	Defect Description	R Defect Prod Start Date	S Defect Prod End Date	T Potential Number Affected	U Actual Number Affected
1	<p>Production Part Number (with 80g precious metal load):</p> <p>2007_A6/A8 - 079.252.019 HK / 020HX, 079.253.019 FX / 020HX 2008_S5 - 8K0.254.250 MXJ & 200CXJ 2008_A6/A8 - 079.252.019 HK / 020HX 2009-10_S5 - 8K0.254.250 MX & 200CX 2009-10_A6 - 079.252.019 HK / 020HX 2011_A6 - 079.252.019 HK / 020HX</p> <p>Improved Part Numbers:</p> <p>2007-08_A8 - 079.253.019 J & 079.253.020 J 2007-11_A6 - 079.253.019 J & 079.253.020 J 2008-10_S5 - 8K0.254.252 E & 8K0.254.200 L</p> <p>During IUVF emissions testing, test group *ADXXV04.2365 (MY 2007 - 2011) showed HC and NOx values over the standards.</p> <p>Parts Analysis:</p> <p>Tested catalytic converters with precious metal loading of 80g /ft3 wash coat were showing phosphor film at the front zone area. At higher mileage, and in particular during a cold start and warm up phase, this may influence catalyst ?light off?? characteristics which may lead to increased HC and NOx levels in excess of standards. Oxygen storage capacity from the catalytic converter is not noticeably reduced.</p> <p>System analysis:</p> <p>Test results have shown that certain conditions may lead to an increase in emissions at higher mileages. This may occur along with high functional stress due to negative load cycling along with coating quality variation.</p>				
2	Currently the *ADXXV04.2365 (MY 2007 - 2011) test groups are the only test groups verified to have potential NOx and HC levels that may exceed the standards.			3453	3453
3	<p>Customer Complaint: MIL on Component: Intake Manifold Production Part Number: 06J 133 185 ES Interim Part Number: 06J 133 201 BD Warranty Replacement Part Number: 06J 133 201 BH</p> <p>The following DTCs were observed:</p> <ul style="list-style-type: none">- P2015 Intake Manifold Runner Position Sensor Range/Performance- P0507 Idle Control System RPM Higher than Expected- P2187 System too lean at idle- P0300704 Misfire Detected <p>Part analysis reflects part number: 06J 133 185 ES</p> <ul style="list-style-type: none">- 28x Cracked/broken plastic rivet head- 1x Binding gear- 1x Vacuum valve stuck closed- 7x No Trouble Found <p>Failure Analysis:</p> <ul style="list-style-type: none">- Cracked/broken plastic rivet heads are caused by a quality issue at supplier.- Abnormal wear in cavity of production tool #2, causes the load-bearing surface to be under specifications, which may lead to cracking/breakage over time.				3445275
4	Some 2012 ? 2014 model year Tacoma vehicles equipped with 1GR-FE engines may exhibit spark knock (detonation) during light acceleration and/or uphill in hot weather (80F or higher). The Engine Control module/ECM (SAE term: Powertrain Control Module/PCM) logic has been modified to reduce the possibility of this condition occurring.			99000	99000
5	Some 2012 ? 2014 model year Tacoma vehicles equipped with 1GR-FE engines may exhibit a MIL ?ON?? condition for the following Diagnostic Trouble Codes (DTCs): P015A - A/F Sensor Delayed Response - Rich to Lean Bank 1 Sensor 1; P015B - A/F Sensor Delayed Response - Lean to Rich Bank 1 Sensor 1; P015C - A/F Sensor Delayed Response - Rich to Lean Bank 2 Sensor 1; and P015D - A/F Sen			89000	89000
6	Some 2012 ? 2014 model year Tacoma vehicles equipped with 1GR-FE engines may exhibit a MIL ?ON?? condition for the following Diagnostic Trouble Codes (DTCs): P015A - A/F Sensor Delayed Response - Rich to Lean Bank 1 Sensor 1; P015B - A/F Sensor Delayed Response - Lean to Rich Bank 1 Sensor 1; P015C - A/F Sensor Delayed Response - Rich to Lean Bank 2 Sensor 1; and P015D - A/F Sen			121000	121000
7	Some 2012 ? 2014 model year Tacoma vehicles equipped with 1GR-FE engines may exhibit a MIL ?ON?? condition for the following Diagnostic Trouble Codes (DTCs): P015A - A/F Sensor Delayed Response - Rich to Lean Bank 1 Sensor 1; P015B - A/F Sensor Delayed Response - Lean to Rich Bank 1 Sensor 1; P015C - A/F Sensor Delayed Response - Rich to Lean Bank 2 Sensor 1; and P015D - A/F Sen			89000	89000
8	Internal analysis have shown that 13 Rex models (S446) with option fast charging alternate current produced between 11/2017 and 12/2017 are equipped with hardware UCU1 and LEB125 PK1. A wrong assignment of configuration parameter during software flash on DMCM (digital motor control module) disables OBD communica	10/31/2017	12/14/2017	180	180
9	Some 2017/2018 model year Cadenza's equipped with 3.3 liter (GDI) engines might experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P0597/P0590/P0599(Thermostat Heater Control Circuit Open/Low/High) set. The main cause is electric short due to inner part crack (guide plug).			9707	767
10	Some 2017/2018 model year Cadenza's equipped with 3.3 liter (GDI) engines might experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P0597/P0590/P0599(Thermostat Heater Control Circuit Open/Low/High) set. The main cause is electric short due to inner part crack (guide plug).			851	1
11	Some 2012 ? 2014 model year Tacoma vehicles equipped with 1GR-FE engines may exhibit spark knock (detonation) during light acceleration and/or uphill in hot weather (80F or higher). The Engine Control module/ECM (SAE term: Powertrain Control Module/PCM) logic has been modified to reduce the possibility of this condition occurring.			121000	121000
12	Some 2012 ? 2014 model year Tacoma vehicles equipped with 1GR-FE engines may exhibit spark knock (detonation) during light acceleration and/or uphill in hot weather (80F or higher). The Engine Control module/ECM (SAE term: Powertrain Control Module/PCM) logic has been modified to reduce the possibility of this condition occurring.			89000	89000

	47. On some 2016-2018 Infiniti Q50 and Q60 vehicles (2.0L engine), a small amount of fuel may seep from the low-pressure fuel hose. Repeated heat stress may be causing deterioration of the hose which may also result in a loss of flexibility. This loss of flexibility may result in slight fuel seepage only upon cold startup.	10/16/2015	7/31/2016	6856	30
	<p>Recent fleet testing of a 3.3L T-GDI engine indicated that performance of N2O control may behave differently than expected. It has not been confirmed that this is a general issue related to the overall performance of the 3.3 T-GDI engine, or an individual performance of the single engine. However, current analysis has raised a possibility that unexpected heat loss due to the turbocharger performance may alter the expected chemical composition and transformation of N2O gas development and control. Additional investigation is underway.</p> <p>Hyundai has not determined that a defect exists at this time, and is not aware if, or of, a specific number of customer vehicles or engines that have experienced this issue in the field. Hyundai's experience to date is limited to one fleet vehicle and its internal review of the N2O chemistry and performance. However, in an abundance of caution, Hyundai is issuing this EDIR as it is considered possible that such performance may occur in the field under some typical driving conditions.</p>			1082	0

	Electric Rear Axle Drive (ERAD) consists of an electric motor combined with a fixed gear transmission and clutch. The electric motor is a water-cooled 3-phase AC synchronous motor for pure electric or hybrid operation, which drives the rear wheels.				
	In addition, the ERAD provides regenerative braking capability that is used to charge the high-voltage battery. A clutch is used to disconnect the electric motor from the transmission, consisting of a worm gear connected to a dog clutch.				
	The defect is confined to the dog clutch that may not allow proper engagement of the electric motor to the transmission.

145	<p>The part numbers 11157601453, 11158635843 and 11158647299 relate to the vent hose connecting line. Part number 11157601453 with index 03 has been used in production between 07/12 and 09/13. Between 10/2013 and 04/14 a modified component with same part number but different index (index 04) has substituted component with index 03 as production and as replacement part. This new part exhibits a notched ring, which should stabilize some due to temperature impact fragile areas of the vent hose connecting line. Between 05/14 and 06/15 an additional hardware improvement on the pipe connector has been introduced in production and as replacement part (part number 11158635843). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. This new component with part number 11158647299 is used since 07/15 in production and as a replacement part for previous model years.</p> <p>Analysis have shown that in about 90% the original assembled part with part number 11157601453 has been replaced because of leakage problems caused by fragile parts of the vent hose connecting line. These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. Since the usage of part number 11158635843, these problems could be reduced to 60% valid replacements.</p> <p>A complete elimination of the hardware issue could be fulfilled with introduction of the new material used with part number 11158647299.</p> <p>The component vent hose connecting line with part number 11158647299 therefore is robust, has/had no malfunction and is/was working properly.</p> <p>Considering the afore mentioned explanations the Weibull results and valid fail values listed in this report relate to the less-robust component vent hose connecting line with part numbers 11157601453 and 11158635843.</p>	2/28/2014	4/29/2014	1150	100

These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. Since the usage of part number 11158635843, these problems could be reduced to 60% valid replacements.</p> <p>A complete elimination of the hardware issue could be fulfilled with introduction of the new material used with part number 11158647299.</p> <p>The component vent hose connecting line with part number 11158647299 therefore is robust, has/had no malfunction and is/was working properly.</p> <p>Considering the afore mentioned explanations the Weibull results and valid fail values listed in this report relate to the less-robust component vent hose connecting line with part numbers 11157601453 and 11158635843.</p>	2/28/2013	4/29/2014	15633	1200
148	<p>The part numbers 11157601453, 11158635843 and 11158647299 relate to the vent hose connecting line. Part number 11157601453 with index 03 has been used in production between 07/12 and 09/13. Between 10/2013 and 04/14 a modified component with same part number but different index (index 04) has substituted component with index 03 as production and as replacement part. This new part exhibits a notched ring, which should stabilize some due to temperature impact fragile areas of the vent hose connecting line. Between 05/14 and 06/15 an additional hardware improvement on the pipe connector has been introduced in production and as replacement part (part number 11158635843). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. This new component with part number 11158647299 is used since 07/15 in production and as a replacement part for previous model years.</p> <p>Analysis have shown that in about 90% the original assembled part with part number 11157601453 has been replaced because of leakage problems caused by fragile parts of the vent hose connecting line. These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. Since the usage of part number 11158635843, these problems could be reduced to 60% valid replacements.</p> <p>A complete elimination of the hardware issue could be fulfilled with introduction of the new material used with part number 11158647299.</p> <p>The component vent hose connecting line with part number 11158647299 therefore is robust, has/had no malfunction and is/was working properly.</p> <p>Considering the afore mentioned explanations the Weibull results and valid fail values listed in this report relate to the less-robust component vent hose connecting line with part numbers 11157601453 and 11158635843.</p>	2/28/2013	4/29/2014	15633	1200

This condition may be caused by the fuel filler door not opening completely, or interference between the fuel filler nozzle splash guard and the fuel door lock switch.			6896	6896
	Some 2015-2018MY 1.4L FIAT Spider Convertible (7BA7?), Jeep Renegade (7BU7?), FIAT 500 (7FF?), FIAT 500X (7FB7?), FIAT LO (7BG7?), FIAT 500L (7BF7?) and 2018 2.0L Alpha Giulia (7GA7?), Alpha Stelvio (7GU7?) vehicles that entered commerce may have a calibration that inadvertently suspended some required On-board Diagnostic (POBD?) monitors when the P1D7F fault code is set.				
197	This issue occurred when the powertrain control software was modified to correct an issue related to the P1D7F code inadvertently setting during uncommon conditions (i.e. low battery voltage, etc.) and resulting in nuisance Malfunction Indicator Light (7MIL?) faults. The resulting 7fix? (making P1D7F a non-MIL code) inadvertently resulted in additional OBD-related issues. In particular, analysis revealed that the P1D7F Diagnostic Trouble Code (7DTC?) would suspend the catalyst monitor, upstream O2 monitor, and upstream closed loop control.			143	143

	<p>The affected part number 13537805423 relates to the PRESSURE ACCUMULATOR (FUEL RAIL).</p> <p>Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2015 Test Group FBMX03.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mi). Please see corresponding EDIR-OF-N57/N47-0267.</p> <p>In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mi). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component PRESSURE ACCUMULATOR (FUEL RAIL) is/was working properly and has/had no malfunction.</p>	6/30/2014	5/31/2015	1505	348
232	DAG has determined that insufficient robustness with regard to environmental impacts, such as increased moisture, could lead to electrical failures of the differential pressure sensor. As a result, the fault is stored in the engine control unit and the engine diagnostics warning lamp (MIL) is activated.			2902	150
234	Some 2016 2.3L Mustang gasoline turbocharged direct injection (GTDI) vehicles may experience damage to the check valve internal seal or have a displaced membrane on the evaporative emissions canister purge valve (CPV), which are both components to the fuel vapor hose assembly.			15928	1458
235	Crankshaft speed sensors (part number 95860643300) are being replaced in the field for MIL illumination. Fault code P0322 is most frequently stored. Analysis shows that a poor solder joint in the connector area leads to premature failure through heat and vibration.	6/7/2013	8/22/2014	10729	26
236	<p>The affected part number 16117243972 relates to the FUEL PUMP (DELIVERY MODULE).</p> <p>Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2015 Test Group FBMX02.0N47, BMW decided a warranty extension to full useful life (10 years / 120.000mi) (please note that the corresponding FR (equivalent to FR F-062.0-9) will be submitted after the reporting threshold 4% and 50 cases is exceeded). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mi). 	<p>DAG has determined that the diesel particulate filter may crack due to an insufficiently robust welded connection. Specific environmental influences in the form of corrosion could also have a negative effect on the long term durability of the diesel particulate filter. This can lead to tensions within the exhaust system and thus also may cause the diesel particulate filter to crack.</p> <p>In addition, in individual cases, it may be that during repairs to the exhaust system that are unrelated to a defect of the diesel particulate filter, the exhaust system was not replaced in accordance with the DAG specifications. Specifically, the issue might arise where it is necessary for the workshop to replace the exhaust system (including the diesel particulate filter) and the replacement system is not fitted according to DAG specifications. This can lead to tensions within the exhaust system and thus may also cause the diesel particulate filter to crack.</p> <p>In both cases, a fault is stored in the engine control unit software and the engine diagnostics warning lamp (MIL) is activated.</p>			15696	2303

	<p>The subject vehicles are equipped with a 3.5L V6 2GR-FSE gasoline engine with an intake port injection system containing two fuel pulsation dampers. The diaphragm material in the fuel pulsation dampers may harden over time due to a chemical process involving amine in the fuel, higher ethanol content in fuels used in countries such as the U.S., Canada, and China, and high temperatures. If this were to occur, cracks could develop on the diaphragm, causing fuel to leak. A fuel leak in the presence of an ignition source can increase the risk of a vehicle fire.</p>			34067	34067

393	<p>Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire.</p> <p>If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs.</p> <p>These can include:</p> <ul style="list-style-type: none">?Coolant loss with Check-Control-Indication?Loss of power with ? if applicable ? Check-Control-Indication (depending on grade of damage)?Smell of exhaust gas?Unusual noise from the engine compartment?Smoke development from the engine <p>In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740Li xDrive 535d and 535d xDrive) produced between 07/01/2013 and 05/31/2017</p>	3/31/2016	7/30/2017	15	15

411	<p>Daimler AG has determined that on certain GLE-Class (platform 166), SL-Class (platform 172), C-Class (platform 204), E-Class (platforms 207, 212), S-Class (platforms 216, 217, 221, 222), CLS-Class (platform 218), SL-Class (platform 231), R-Class (platform 251), GLC-Class (platform 253), G-Class (platform 463) vehicles with 4-, 6- and 8-cylinder gasoline engines catalyst heating might not be active in one special use case. The issue only occurs when the following unusual circumstances occur in combination: The engine is turned off after a driving cycle where it was fully warmed up. At the next engine-start / driving cycle the engine is started and turned off after no more than 2 seconds of operation. At the subsequent engine start / driving cycle catalyst-heating is not activated. In this case, due to a delayed heating up of the catalyst, an impact on emissions cannot be ruled out.</p>			1387	0
412	<p>Daimler AG has determined that certain MY12-18 vehicles of diverse platforms could experience a software error. If a shortcut occurred within the injector while the engine was switched off, the failure code for this short cut would not be stored and the MIL would not be activated. However, in case of a confirmed shortcut, the MIL would be activated by a subsequent failure mechanism (misfire detection) and the workshop would replace the correct part. Based on a field claim analysis of potentially affected vehicles worldwide, the probability of occurrence of the described failure is lower than 0.00018 %.</p>			78571	0

422	<p>The affected part number 16127207422 and 16127207423 relate to the REAR FUEL RETURN LINE (RETURN PIPE). Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2017 Test Group HBKMT03.0N57, a final decision based on the final analysis results is expected in Q1/2019 (e.g. if a warranty extension to full useful life (10 years / 120.000mils; equivalent to EDIR-DE-NS7-0177) or any other measurement (as e.g. a service campaign with replacement of component high pressure fuel pump at next service visit) will be decided). In case the high pressure fuel pump is pre-damaged or already malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component REAR FUEL RETURN LINE (RETURN PIPE) is/was working properly and has/had no malfunction.</p>	7/31/2016	7/31/2017	2614	544

463	In certain vehicles the pre-catalyst oxygen sensors may fail due to cracking of the sensor's internal sensing element. Certain operating conditions may lead to element degradation making it susceptible to cracking under vibration or shock.				136496	48
464	In certain vehicle the camshaft position actuator oil control solenoid valve (OCV) may fail due to excessive internal wear between components or a broken internal electrical wire.				32640	2218
	<p>Failed Malfunction Indicator Light illumination. Normal operation requires MIL illumination where Fueling Adaption values are between 0.07% to 0.08% and -0.07% to -0.08% additionally a Diagnostic Trouble Code is set. Investigation has revealed MIL illumination will not occur between 0.0798% to 0.08% and -0.0798% to -0.08%.</p>				26966	91

549	On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL).	5/1/2017	4/30/2018	5011	0
550	On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL).	5/1/2018	4/30/2019	1180	0
551	On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL).	5/1/2018	4/30/2019	129	0
552	On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL).	5/1/2018	4/30/2019	41	0
	<p>Analyses have shown, that in about 43% of all cases the component fuel injector was replaced due to a valid malfunction of the component fuel injector itself. Based on poor diesel fuel quality an extended plate-out/coat inside the injector is possible. This coat results in an increased pilot injections correction. If the adaption limit monitoring/corrected energizing time exceeds a time threshold (e.g. 250 Tsec), a corresponding OBD fault code (e.g. DTC P0220 for injector 1) including MIL illumination is set (injection quantity monitoring /Zero Fuel Calibration (ZFC)). In about 50% of all cases the component injector was replaced besides the malfunctioning component high pressure fuel pump (according service instruction) due to contamination of the high/low pressure system with cuttings (please see also e.g. EDIR-0P-A47/AS7-0207 or EDIR-OH-NS7-0241). In the other about 7% the component fuel injector was replaced without any valid reason (e.g. no corresponding fault code indicating a malfunctioning fuel injector).</p>	6/30/2016	6/29/2017	1502	269
	<p>On certain six-cylinder diesel E350 BlueTec vehicles, the intake port shutoff actuator motor could have failed due to electrical short circuit faults. These are caused by oil contamination coming from a leaky clean air line connector to the turbo charger, positioned directly above the actuator motor.</p> <p>In the clean air line, blow-by-gas is mixed with clean air. Usually blow-by-gas contains traces of oil due to crank case ventilation. In case of a leakage at the clean air line connector, oil could weep after engine stand still. As long the engine is running, there is underpressure in the clean air line, so it is ensured blow-by-gas can't get out at the connector.</p> <p>The oil contamination could crawl inside the actuator housing and could lead to electrical short circuit faults. These short circuit faults would lead to a failing of the actuator motor and an illumination of the Malfunction Indicator Lamp (MIL).</p> <p>The root cause of the leakage is incorrect reinstallation of the clean air line in some workshops. The incorrect reinstallation is a deviation from our work instruction.</p> <p>There is no known fault caused by the actuator motor itself.</p>			9946	111

	<p>On certain six-cylinder diesel GL/ML/S 350 BlueTec vehicles, the clean air line could have failed due to signal range check faults. These could be caused by incorrect reinstallation of the connectors of the air mass flow sensor and temperature sensor during repair and maintenance work on various components that require the installation and removal of the clean air line. The air mass flow sensor and temperature sensor are part of the clean air line.</p> <p>This leads to deviation of range of the measured air mass and air temperature to the calibration. The deviation will result in illumination of the Malfunction Indicator Lamp (MIL), prompting the driver to visit a servicing dealer. In this case, an emission influence is not expected. The incorrect reinstallation is a deviation from our work instruction.</p>					56260

	<p>Some 2019*2020 model year KIA Sedona equipped with 3.3L engine have experienced a malfunction indicator light (MIL) illumination with a Diagnostic trouble code (DTC) P0456. Code P0456 indicates a small leak detected in the Evaporative Emissions (EVAP) system. According to the investigation, the main cause is an improper data calibration for leakage diagnosis. This occurs when t</p> <p>On some 2015-2019 Nissan and Infiniti models, it was discovered that some permanent DTCs (P0101, P0448, P0087, P2008) may not clear properly during the OK judgment cycle due to incorrect passing logic being applied.</p> <p>On some 2015-2019 Nissan and Infiniti models, it was discovered that some permanent DTCs (P0101, P0448, P0087, P2008) may not clear properly during the OK judgment cycle due to incorrect passing logic being applied.</p> <p>On some 2015-2019 Nissan and Infiniti models, it was discovered that some permanent DTCs (P0101, P0448, P0087, P2008) may not clear properly during the OK judgment cycle due to incorrect passing logic being applied.</p> <p>On some 2015-2019 Nissan and Infiniti models, it was discovered that some permanent DTCs (P0101, P0448, P0087, P2008) may not clear properly during the OK judgment cycle due to incorrect passing logic being applied.</p> <p>On some 2015-2019 Nissan and Infiniti models, it was discovered that some permanent DTCs (P0101, P0448, P0087, P2008) may not clear properly during the OK judgment cycle due to incorrect passing logic being applied.</p> <p>On some 2015-2019 Nissan and Infiniti models, it was discovered that some permanent DTCs (P0101, P0448, P0087, P2008) may not clear properly during the OK judgment cycle due to incorrect passing logic being applied.</p> <p>On some 2015-2019 Nissan and Infiniti models, it was discovered that some permanent DTCs (P0101, P0448, P0087, P2008) may not clear properly during the OK judgment cycle due to incorrect passing logic being applied.</p> <p>On some 2015-2019 Nissan and Infiniti models, it was discovered that some permanent DTCs (P0101, P0448, P0087, P2008) may not clear properly during the OK judgment cycle due to incorrect passing logic being applied.</p> <p>On some 2015-2019 Nissan and Infiniti models, it was discovered that some permanent DTCs (P0101, P0448, P0087, P2008) may not clear properly during the OK judgment cycle due to incorrect passing logic being applied.</p> <p>On some 2015-2019 Nissan and Infiniti models, it was discovered that some permanent DTCs (P0101, P0448, P0087, P2008) may not clear properly during the OK judgment cycle due to incorrect passing logic being applied.</p> <p>On some 2015-2019 Nissan and Infiniti models, it was discovered that some permanent DTCs (P0101, P0448, P0087, P2008) may not clear properly during the OK judgment cycle due to incorrect passing logic being applied.</p>					122595604061291065402850431446977958661645458410825480611
	<p>On certain vehicles, the six (6) front exhaust pipe nuts at the cylinder heads may not have been tightened sufficiently due to variations in production. As a result, these nuts may become loose during use and cause exhaust leakage that may fail to meet emission-related regulations.</p>					198323
	<p>Cap less unit lower flap open/close function not robust enough. Therefore may intermittently not seal properly after refuelling.</p>					14461446

	Due to inappropriate PCM software, the 12V battery state of charge may be estimated to be lower than the actual state of charge. As a result, under certain driving conditions the idle stop operation may be incorrectly inhibited.	7/15/2016	3/27/2017	11247	24

668	Some 2014*2016 model year Hyundai Elantra 2.0L, Elantra Coupe 2.0L and Kia Forte 2.0L may exhibit an issue with NMOC control that could lead to an exceeding of the emissions standards under a certain specific condition such as when the catalyst heating control is not activated. Hyundai has refined BMS data so that catalyst heating is entered to ensure the catalyst reaches the act			1977	2
	Daimler has identified two main root causes, which may lead to replacement of the pressure gauge converter.				
	1) The diagnostic thresholds of the pressure gauge converter sensor might be calibrated too sensitively/narrowly. Therefore, in certain circumstances, an error of the pressure gauge converter sensor could be set and the MIL could be activated erroneously. In this case, the sensor is actually not malfunctioning.				
	2) An incorrect position of the gold plates within the pressure gauge converter sensor can lead to internal short circuits to ground. Therefore, an error of the pressure gauge converter sensor could be set and the MIL could be activated.

	The affected part number 13538506546 relates to the FUEL RAIL-INJECTOR FUEL LINE. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBM0V03 0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils) Please see corresponding EDIR-OG-N57/N47-0311) will be submitted after the reporting threshold ¼% and >50 cases is exceeded). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FUEL RAIL-INJECTOR FUEL LINE is/was working properly and has/had no malfunction.	6/30/2015	10/30/2016	1209	298
670	On some 2019 Nissan Altima vehicles, the fuel pump lock ring that secures the fuel pump module to the fuel tank may have been installed incorrectly during production. More specifically, the lock ring may not have been completely engaged during re-installation following offline rework at the supplier. If the fuel pump lock ring is e	2/20/2019	3/1/2019	8100	347
	The affected part number 16117341299 relates to the Fuel Tank Supply Module. Analyses have shown, that the component fuel tank supply module in general was replaced due to a software failure in the ECU (Engine Control Unit). In more detail: The component PT-sensor (pressure/temperature sensor) located inside of the fuel tank supply module is/was monitored also during driving conditions. This could lead to the scenario, that the PT-sensor shows an implausible value (e.g. temperature drop) due to contact with fuel and the OBD diagnostic detects the PT-sensor as malfunctioning (including the corresponding fault code and MIL illumination) although the component PT-sensor is not malfunctioning. As a result the malfunctioning ?? PT-sensor was replaced in services by replacing the complete fuel tank supply module. This means that in general the component fuel tank supply module was replaced without being malfunctioning. Beginning with July 2013, BMW has modified the ECU software so that the OBD diagnostics for component PT-sensor are only running during engine off time conditions to avoid the false failure detection and false MIL as described above.	2/29/2012	6/29/2012	0	0
672	DAG has determined that insufficient robustness of the exhaust gas temperature sensor with regard to vibration and thermal shock could lead to electrical failures. Vibration or thermal shock might lead to delamination of the conduction, loss of adhesion of the chip in the measuring tip, fracture of the ceramic or disruption of the cement seal. As a result, a fault is stored in the engine co			4597	25

	<p>The affected part number 13537823402 relates to the FRONT FUEL RETURN LINE. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMXV03.0N57, BMW decided a warranty extension to full useful life (10 years / 120,000mi) (Please see corresponding EDIR-OG-N57/N47-0311). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50,000mi). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component MIDDLE FUEL RETURN LINE is/was working properly and has/had no malfunction.</p>	6/30/2015	10/30/2016	1209	298	
689	<p>The affected part number 16117260648 relates to the component DELIVERY UNIT W/IN-TANK FUEL PUMP. Analyses have shown that this component in general (in about 93% of all cases) was replaced in service in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2015 Test Group GBMXV03.0N57, BMW decided a warranty extension to useful life (10 years / 120,000mi); please note that the corresponding FIR (equivalent to FIR-F0E-3.0-11) will be submitted after the reporting threshold <4% and > 50 cases is exceeded). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50,000mi). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component delivery unit w/in tank fuel pump was replaced in the other 7% of all cases.</p>	2/28/2014	6/29/2015	1505	160	
690	Daimler AG has determined that on certain GT-, C- and G-Class vehicles (190, 205 and 463 platforms) the engine control unit software could have a mistake in the calibration data set relating to catalyst heating. In case of the engine being shut down for more than 67 hours, the catalyst heating created by an increase of the idling speed might not be initiated with the next engine start as			1117	0	
	<p>Front oxygen sensor, UHEGO, (linear zirconium sensor, heated air/fuel ratio sensor). Initial analysis indicates possible silicon contamination inside the front oxygen sensor. If this condition occurs, DTC code P017100 (MIL), long term fuel trim too lean will be set.</p>

	<p>A manufacturing fault at the supplier results in misalignment within the post-catalyst heated oxygen sensor leading to a side load on a ceramic internal part. This pre-stress, in combination with normal vehicle use, may lead to premature component malfunction. Additionally, a deficiency in the Engine Control Module (ECM) calibration may lead to the heated sensing element experiencing thermal shock following water contact leading to sensor malfunction. Both conditions cause the Malfunction Indicator Lamp (MIL) to be illuminated and diagnostic trouble codes (DTCs), relevant to the post-catalyst heated oxygen sensors, to be stored in the Engine Control Module (ECM), also known as the Powertrain Control Module (PCM).</p>				2063	753

	<p>The affected part number 16117243975 relates to component FUEL PUMP [DELIVERY MODULE] by supplier Bosch. Analyses have shown that the impeller inside the fuel pump could block due to high dust contamination in combination with NiP (Nickel-Phosphor) abrasion and accumulation (separated NiP particles from the internal fuel pump coating). Particularly the production period 09/2013 through 03/2014 shows an increased risk of potential blocking due to a coating charge with >8% Phosphor. The NiP coating was primarily introduced to increase the durability regarding ethanol. Due to the potential blocking, the coating in the fuel pump was changed to Eloxal beginning with 04/2014 (fuel pump built in production and fuel pump used as replacement part in service). This more robust hardware (to prevent the potential blocking of the impeller) has still part number 16117243975.</p>	8/31/2013	3/30/2014	25000	2500

	Q	R	S	T	U
	<p>The affected part number 16117243975 relates to component FUEL PUMP [DELIVERY MODULE] by supplier Bosch. Analyses have shown that the impeller inside the fuel pump could block due to high dust contamination in combination with NiP (Nickel-Phosphor) abrasion and accumulation (separated NiP particles from the internal fuel pump coating). Particularly the production period 09/2013 through 03/2014 shows an increased risk of potential blocking due to a coating charge with >8% Phosphor. The NiP coating was primary introduced to increase the durability regarding ethanol. Due to the potential blocking, the coating in the fuel pump was changed to Eloxal beginning with 04/2014 (fuel pump built in production and fuel pump used as replacement part in service). This more robust hardware (to prevent the potential blocking of the impeller) has still part number 16117243975.</p>				
703	The OBD system may falsely detect a malfunction of the P0461 "Fuel Level Sensor (Rationality)" in a certain condition.	8/31/2013	3/30/2014	25000	2500
		10/5/2018		2828	2
704	The warranty claims for the fill-level sensor in the G-class series are based on the following root cause: different geometric characteristics of the fill-level sensor of the oil tank after a supplier change could cause an occasional message in the instrument cluster 'oil level too high'?, even though the oil level is within the limit. The sensor itself is not defective but the geometric characteristics are.			24	1

	Daimler AG has determined that the soot particulate sensor could fail due to the following root causes: Root Cause A: Particles on the sensor element resulting from the manufacturing process. Root Cause B: Flaking of the electrode due to insufficient evaporation of humidity inside the sensor element. Both root causes lead to an electrical failure of the soot particulate sensor. In case of failure the Malfunction Indicator Lamp (MIL) is illuminated.				
706				8170	367
	Calibration Concerns: Scan Tool Mode 50A, this is a Non-erasable permanent DTCs (Mode 50A) for fuel rail pressure monitoring. The issue was discovered during PVE [J][J2] testing and was reported to the agencies on May 7, 2018 (Gen 2.1 SUV and July 2, 2018 (Gen 2 PC) Calibration Concerns: NOx-Sensor Rationality monitor, this is a NOx Sensor out-of-range monitor without function (P2202, P2203, P22A0 and P22A1). The issue was discovered during PVE [J][J2] testing and was reported to the agencies on May 7, 2018 (Gen 2.1 SUV and July 2, 2018 (Gen 2 PC) Calibration Concerns: Throttle Valve Rationality monitor: The issue was discovered during PVE [J][J2] testing and was reported to the agencies on May 7, 2018 Calibration Concerns: Oxidation Catalyst (DOC) efficiency monitor, The issue occurs during high altitude driving conditions, requires replacement of the DOC (impacting durability), and is caused by a modified calibration in the field fix. To fix this issue will require a modification to the AEM Calibration Concerns: Boost system Rationality monitor, Boost system gross leakage monitor with limited function. The issue was discovered during PVE [J][J2] testing and was reported to the agencies on May 7, 2018 Calibration Concerns: Engine Control Module (ECM) inhibit relations, Planned improvements of inhibit relations to avoid additional fault codes and ensure reliable guidance for service. The issue was discovered during PVE [J][J2] testing and was reported to the agencies on July 2, 2018. Calibration Concerns: Engine Control Module (ECM) Injection Limitation, Reduction of the fuel injection pattern at high ECM temperatures and low battery voltage. This issue has not caused customer complaints and is unlikely to occur in ordinary driving conditions. Fixing this issue does not require changing the AEM. Calibration Concerns: Service-Tester/Tools, Service base setting to adjust idle speed. This is a minor change designed for dealer diagnostics. It does not change the AEM calibration Calibration Concerns: Vehicle Drivability (Poor Fuel Adaptation), Customer complaints regarding drivability during engine warm-up. The issue affects drivability of the vehicle, occurs during ordinary vehicle operation and use, and is caused by a modified calibration in the field fix. To fix this issue will require a modification to the AEM. Calibration Concerns: Reductant Supply Module, The SCR module is being replaced due to a false MIL condition resulting from high temperatures/diagnostic thresholds of consumption deviation monitor. The change will impact the AEM calibration, but the change is not required to fix this Technical issue. The proposed change is an improvement for the issue, but not a complete solution. 709	Some plastic fuel tanks were incorrectly manufactured, as a result the fuel pump float may become stuck to the fuel tank inner wall and not accurately reflect the actual fuel level in the tank. Due to inaccurate fuel gauge reading, in some cases vehicle may run out of fuel resulting in an engine stall.	4/2/2015	10/5/2015	4	0
710	Some plastic fuel tanks were incorrectly manufactured, as a result the fuel pump float may become stuck to the fuel tank inner wall and not accurately reflect the actual fuel level in the tank. Due to inaccurate fuel gauge reading, in some cases vehicle may run out of fuel resulting in an engine stall.	8/8/2013	8/9/2013	1	0
711	Malfunctions can occur in the passenger air bag system, turn signals, and/or the engine starting system in addition to false instrument cluster warnings. This is caused by weak retention force of wiring harness connector terminals, resulting in electrical communication disruption between various vehicle control modules.	9/11/2017	11/8/2017	7854	193
	Some 2015 - 2017 MY Jeep, Renegade, RAM ProMaster City and Fiat 500X vehicles may experience engine cooling fan noise, engine cooling fan module failure and/or a P0481 diagnostic trouble code (DTC) for "Cooling Fan 2 Control Circuit Malfunction" triggering the check engine lamp, or MIL, to illuminate. Failure of the engine cooling fan motor can cause the engine to overheat and possible engine damage/failure due to overheating.				
712	Root cause was determined to be excessive friction and loads between motor bushing and shaft due to inadequate lubrication content in the bushing, out of specification cylindricity and sub-standard radial strength. This could lead to bushing wear and, under certain conditions, cause the engine cooling fan to fail.			90311	90311

	Q	R	S	T	U
	<p>The affected part number 13538506548 relates to the Fuel Injector. Analyses have shown, that depending on test group and model year in about 15% up to 52% of all cases the component fuel injector was replaced due to a valid malfunction of the component fuel injector itself. Based on poor diesel fuel quality an extended plate-out/coat inside the injector is possible. This coat results in an increased pilot injections correction. If the adaption limit monitoring-corrected energizing time exceeds a time threshold (e.g. 250 7sec), a corresponding OBD fault code (e.g. DTC P02CD for injector 1) including MIL illumination is set (injection quantity monitoring 7Zero Fuel Calibration (ZFC)). Depending on test group and model year in about 25% up to 84% of all cases the component injector was replaced besides the malfunctioning component high pressure fuel pump (according service instruction) due to contamination of the high/low pressure system with cuttings (please see also e.g. EDIR-OF-N47/NS7-0267 or EDIR-QH-NS7-0324). In the other 2% up to 35% (depending on test group and model year) the component fuel injector was replaced without any valid reason (e.g. no corresponding fault code indicating a malfunctioning fuel injector).</p>	6/30/2015	10/29/2016	1209	38
729	<p>The affected part number 13538506548 relates to the Fuel Injector. Analyses have shown, that depending on test group and model year in about 15% up to 52% of all cases the component fuel injector was replaced due to a valid malfunction of the component fuel injector itself. Based on poor diesel fuel quality an extended plate-out/coat inside the injector is possible. This coat results in an increased pilot injections correction. If the adaption limit monitoring-corrected energizing time exceeds a time threshold (e.g. 250 7sec), a corresponding OBD fault code (e.g. DTC P02CD for injector 1) including MIL illumination is set (injection quantity monitoring 7Zero Fuel Calibration (ZFC)). Depending on test group and model year in about 25% up to 84% of all cases the component injector was replaced besides the malfunctioning component high pressure fuel pump (according service instruction) due to contamination of the high/low pressure system with cuttings (please see also e.g. EDIR-OF-N47/NS7-0267 or EDIR-QH-NS7-0324). 	<p>Component: Fuel low pressure sensor (LPS). The LPS provides a value for closed loop control of the fuel pressure before the high pressure fuel rail.</p> <p>The circuit board inside the LPS is protected by a gel coating. The analysis of returned warranty parts indicate the gel has been found to be in various states of degradation. If the gel is degraded damage to the circuit board may occur, resulting in an activation of the Malfunction Indicator Lamp (MIL). If the sensor fails table values are used as replacement for the fuel pump target load.</p> <p>The concerned sensor went of production 2016 week 16.</p>

786	Due to inappropriate PCM software, the 12V battery state of charge may be estimated to be lower than the actual state of charge. As a result, under certain driving conditions the idle stop operation may be incorrectly inhibited.	9/23/2015	7/12/2016	17594	68
787	Due to inappropriate PCM software, the 12V battery state of charge may be estimated to be lower than the actual state of charge. As a result, under certain driving conditions the idle stop operation may be incorrectly inhibited.	7/14/2014	9/17/2015	37330	544
	<p>The affected part number 1613719479 relates to the Leak Diagnostic Pump. Analyses have shown, that in about 85% of all cases the component Leak Diagnostic Pump was replaced due to a malfunction including fault code storage and MIL illumination. Main reason for the defect is corrosion due to condensate entry in the Leak Diagnostic Pump which leads e.g. to electrical malfunctions.</p> <p>In addition the component Leak Diagnostic Pump was replaced due to variations of the friction coefficient (leads to current fluctuations during the reference leak measurements) caused by unsteady manufacturing quality. As a result a leakage of the EVAP system was misleadingly detected.</p>

	DAG has identified two main root causes, which may lead to replacement of the exhaust gas recirculation valve: 1.A sluggish exhaust gas recirculation valve, due to foreign particles or carbon build up, could lead to a deviation during exhaust gas recirculation control. The deviation will result in illumination of the Malfunction Indicator Lamp (MIL), prompting the driver to visit a servicing dealer. 2.An external leakage of the exhaust gas recirculation valve through the connection fitting could result in water with coolant entering the engine bay. Due to the leakage of the exhaust gas recirculation valve, the coolant level might drop gradually, resulting in a warning ?check coolant level?? being displayed in the instrument panel.			2257	23

	The affected part number 13517588879 relates to the high pressure pump from supplier Continental which is also currently used as replacement part in services. Analyses have shown, that in about 90% of all cases due to confirmed malfunctions of the high pressure pump. Main reasons for the high pressure fuel pump malfunctions are oil losses caused by a cracked coupling or shaft spin. Both malfunctions, which can effect emissions, lead to reduced pressure in the fuel system and result in a pressure fuel pump and engine limp home with noticeable engine performance reduction (including MIL illumination). In addition, the high pressure fuel pump is also replaced due to a sporadically sticking flow control valve which results in fault code storage and occasionally MIL illumination. In the about other 10% of all cases the component high pressure pump was replaced without any corresponding fault code storage and without MIL illumination.	8/31/2009	7/30/2010	737	216

	Daimler has identified two main root causes, which may lead to replacement of the pressure gauge converter. 1) The diagnostic thresholds of the pressure gauge converter sensor might be calibrated too sensitively/narrowly. Therefore, in certain circumstances, an error of the pressure gauge converter sensor could be set and the MIL could be activated erroneously. In this case, the sensor is actually not malfunctioning. 2) An incorrect position of the gold plates within the pressure gauge converter sensor can lead to internal short circuits to ground. Therefore, an error of the pressure gauge converter sensor could be set and the MIL could be activated.

816	Daimler AG has determined that, in case a fault is detected by the monitors of the oxygen sensor heaters, specific values which can be read out by the Generic Scantool may be updated more often than specified by OBD regulations. The functionality of the monitors themselves, as well as fault freeze frame data, is not affected. In case of a detected fault, the malfunction indicator lamp w			8873	0
	If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine N74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.	6/30/2017	6/29/2018	6904	6904

In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine N74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.	6/30/2017	6/29/2018	6904	6904
818					
	If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). 840	<p>If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine N74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.</p>	2/28/2019	5/7/2019	63784	63784

842	<p>The affected part number 13537823395 relates to the FUEL LINE TO HIGH-PRESSURE PUMP. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMXV03.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils) (Please see corresponding EDIR-OG-N57/N47-0311) will be submitted after the reporting threshold >4% and >50 cases is exceeded).</p> <p>In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FUEL LINE TO HIGH-PRESSURE PUMP is/was working properly and has/had no malfunction.</p>	6/30/2015	10/30/2016	1209	298
843	<p>Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire.</p> <p>If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs.</p> <p>These can include:</p> <ul style="list-style-type: none">?Coolant loss with Check-Control-Indication?Loss of power with ? if applicable ? Check-Control-Indication (depending on grade of damage)?Smell of exhaust gas?Unusual noise from the engine compartment?Smoke development from the engine <p>In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740Li xDrive 535d and 535d xDrive) produced between 07/01/2013 and 05/31/2017</p>	6/30/2016	6/29/2017	1204	1204

Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs.</p> <p>These can include:</p> <ul style="list-style-type: none">?Coolant loss with Check-Control-Indication?Loss of power with ? if applicable ? Check-Control-Indication (depending on grade of damage)?Smell of exhaust gas?Unusual noise from the engine compartment?Smoke development from the engine <p>In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740Li xDrive 535d and 535d xDrive) produced between 07/01/2013 and 05/31/2017</p>	6/30/2015	6/29/2016	1792	1792
847	<p>Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire.</p> <p>If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs.</p> <p>These can include:</p> <ul style="list-style-type: none">?Coolant loss with Check-Control-Indication?Loss of power with ? if applicable ? 	<p>Hyundai Motors America, Inc. is conducting an important Product Improvement Campaign to update software on 2011~2019 MY Sonata, 2013~2019 MY Santa Fe Sport, 2014~2015 MY and 2018~2019 MY Tucson, and 2019MY Veloster N vehicles equipped with 2.0L and 2.4L GDI engines to protect the engine from connecting rod bearing damage.</p> <p>The update will only involve the addition of newly developed computer software for the Engine Control Unit (ECU).</p> <p>Hyundai recently developed a Knock Sensor Detection System (KSOS) that detects vibrations indicating the onset of connecting rod bearing wear in the engine.</p> <p>The KSOS is designed to alert a vehicle driver at an early stage of bearing wear before the occurrence of engine damage including engine failure.</p> <p>881 Some Kia 20MY Forte 2.0MPI vehicles have an issue that displays incorrect test group information to a scan tool. According to the investigation, there was a clerical error in the ECU calibration.</p> <p>882 Some Kia 20MY Forte 2.0MPI vehicles have an issue that displays incorrect test group information to a scan tool. 897	Due to improper Engine Control Module (ECM) programming, under certain circumstances, the ignition coil may be energized longer than designed after the engine is OFF. If the ignition coil remains energized for too long, the internal temperature of ignition coil may increase which could cause a short circuit and a blown fuse. If a s	7/28/2016	8/15/2017	74956	9
898	On some 2019 Nissan Kicks vehicles, customers may have experienced MIL illumination for various engine control related DTCs and/or an engine shut off condition at idle. Nissan has investigated and found that in some cases, the main EGI harness may press against the metal battery bracket, potentially causing damage to the wire sheathing. If this should occur, there is potential for a			42496	202
	<p>Some 2010*2015 model year Hyundai Tucson 2.4L may exceed the ORVR standard.</p> <p>According to an investigation of canister manufacturing process/subpart/production history, Analysis indicates that the displacement of the charcoal occurs nearly immediately. Because the Defect sponge inside the canister is too short in length, so charcoal dislodging occurs with the combination of charcoal tilting and the short sponge length. As a countermeasure, a supplemental canister will be applied between the faulty canister and the Canister Close Valve (CCV) for those canisters that fail an inspection. Hyundai will add the 150cc auxiliary canister for the vehicles that fail an inspection through a voluntary service campaign (VERR) with customer notification.</p>			10746	1

	<p>Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire. If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs. These can include: Coolant loss with Check-Control-Indication Loss of power with 7 if applicable 7 Check-Control-Indication (depending on grade of damage) Smell of exhaust gas Unusual noise from the engine compartment Smoke development from the engine in all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740Li xDrive 555d and 535d xDrive) produced between 07/01/2013 and 05/31/2017).</p>	6/30/2015	6/29/2016	1792	1792

930	On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.02077 leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL).	5/1/2017	4/30/2018	352	0
931	<p>The affected part number 13538627842 relates to the FUEL INJECTOR which is used beginning with 04/2017 solely as replacement part in service when original built injector with part number 13537645956 has to be replaced. Fuel injector with part number 13538627842 includes an improvement regarding tightness due to a DLC (Diamond-Like-Carbon) coated ball inside of the injector. The following analysis applies therefore to the original built fuel injector with part number 13537645956.</p> <p>Analysis have shown, that the component has been replaced in about 31% up to 42% (depending on Test Group) due to malfunctions of the component itself. The main reason for those malfunctions could be identified in defective filter material. In case this material shows breaks pollutant particles lead to temporary or steady leakages of the injection valve. These leakages could have an impact on drivability (e.g. bucking engine run) showing misfires, which are detected by OBD system storing a fault code with MIL illumination. More reasonable malfunctions are caused by sooting of the valve injection holes or damaged valves (e.g. breaks in valve seat or broken valve seats).</p> <p>In the other 58% up to 69% (depending on Test group) of all cases, the component injection valve has been replaced although it hasn't had a malfunction itself. Other components like ignition coil, high pressure sensor or ignition plugs have been in those cases the genuine reason for fault code storage and MIL illumination.</p>	2/28/2014	6/29/2015	11459	963

	The affected part number 13537823399 relates to the INJECTOR LEAKAGE LINE. Analysis have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2015 Test Group FBMX703.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils). Please see corresponding EDIR-OF-N57/147-0267. In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component INJECTOR LEAKAGE LINE is/was working properly and has/had no malfunction. 1046	7/31/2014	6/30/2015	7396	967

In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component pressure accumulator (fuel rail) is/was working properly and has/had no malfunction.</p>	7/31/2014	6/30/2015	1832	255
1042	<p>The affected part number 13537800601 relates to the Pressure Accumulator (Fuel Rail). Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2015 Test Group FBMXV02.0N47, BMW decided a warranty extension to full useful life (10 years / 120.000mils). Please see corresponding EDIR-OF-N57/N47-0267. In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component pressure accumulator (fuel rail) is/was working properly and has/had no malfunction.</p>	6/30/2014	5/31/2015	1483	153
1049	<p>7 pre catalyst oxygen sensors (pn 9A260618301) are being replaced in the field for MIL illumination and fault code P2196 stored in the Engine ECU. 7 Part are being replaced due to defective ceramic elements 7 Analyses revealed water residues inside of the ceramic element of the sensor. These residues of water stuck in the porous ceramic element can lead to a defect of the sensor during sensor heating.</p>	3/17/2016	3/17/2017	5597	111

The fuel filter material has been changed.			9799	78
1077	High pressure fuel pumps (part numbers 9A111031506 and 9A1110315FX) are being replaced in the field due to the MIL being illuminated. Faults P1281, P053F and P1021 are most frequently stored. It has been determined that the material in the fuel filter was allowing dirt particles that were too large to enter the high pressure fuel pump. This would cause damage to the pump. The fuel filter material has been changed.			9799	78
1078	High pressure fuel pumps (part numbers 9A111031506 and 9A1110315FX) are being replaced in the field due to the MIL being illuminated. Faults P1281, P053F and P1021 are most frequently stored. It has been determined that the material in the fuel filter was allowing dirt particles that were too large to enter the high pressure fuel pump. This would cause damage to the pump. The fuel filter material has been changed.			10574	96
1079	High pressure fuel pumps (part numbers 9A111031506 and 9A1110315FX) are being replaced in the field due to the MIL being illuminated. Faults P1281, P053F and P1021 are most frequently stored. It has been determined that the material in the fuel filter was allowing dirt particles that were too large to enter the high pressure fuel pump. This would cause damage to the pump. The fuel filter material has been changed.			10574	96
1080	High pressure fuel pumps (part numbers 9A111031506 and 9A1110315FX) are being replaced in the field due to the MIL being illuminated. Faults P1281, P053F and P1021 are most frequently stored. It has been determined that the material in the fuel filter was allowing dirt particles that were too large to enter the high pressure fuel pump. This would cause damage to the pump. The fuel filter material has been changed.			9799	78

	High pressure fuel pumps (part numbers 9A111031506 and 9A1110315FX) are being replaced in the field due to the MIL being illuminated. Faults P1281, P053F and P1021 are most frequently stored. It has been determined that the material in the fuel filter was allowing dirt particles that were too large to enter the high pressure fuel pump. This would cause damage to the pump. The fuel filter material has been changed.			10574	96
	High pressure fuel pumps (part numbers 9A111031506 and 9A1110315FX) are being replaced in the field due to the MIL being illuminated. Faults P1281, P053F and P1021 are most frequently stored. It has been determined that the material in the fuel filter was allowing dirt particles that were too large to enter the high pressure fuel pump. This would cause damage to the pump. The fuel filter material has been changed.			10574	96
	Throttle body hoses (part numbers 95B145832A, 95B145832B and 95B145832C) are being replaced in the field for illuminating the MIL and partial loss of engine power. Fault P0299 is usually stored. The boot becomes dislodged from the throttle body, causing an air leak. Analysis found that it was improper assembly at the factory was the cause. The boot and assembly process were changed to make assembly easier and more secure.			3209	26
	A manufacturing fault at the supplier results in misalignment within the post-catalyst heated oxygen sensor leading to a side load on a ceramic internal part. This pre-stress, in combination with normal vehicle use, leads to premature component malfunction. The condition causes the Malfunction Indicator Lamp (MIL) to be illuminated and diagnostic trouble codes (DTCs), relevant to the post-catalyst heated oxygen sensors, to be stored in the Engine Control Module (ECM), also known as the Powertrain Control Module (PCM).			5349	115
	? VVS Camshaft Adjustment Actuator Valves (Part#9A110530803) are being replaced in the field for illuminating the MIL, prompting immediate customer action. ? The Variable Valve Lift Control Monitor compares the difference between cylinder banks during small and large lift in closed loop operation, when the measured difference is larger or less than 18% then DTC P1381 or P1382 (P1381[Bank1] / P1382[Bank2]; comparison of closed loop regulator differences between cylinder banks during small and large lift) is set. ? Analyses revealed a deformation inside of the VVS valve, caused by low temperature during the manufacturing process. This leads to an incomplete closing of the valve.	6/6/2013	5/27/2014	10574	47

	Acustomer may report the malfunction indicator lamp (MIL) is illuminated, lack of power and sometimes noise coming from the engine bay. The stored diagnostic trouble code (DTC) points to "turbocharger under-boost" which results from a failure of the Turbo-Exhaust Manifold. 1112 Jaguar Land Rover introduced a brazed scroll manifold which at high time in service is starting to disintegrate. The root cause being a combination of thermal fatigue and vibrations which will make the joints loose.			3405	1089
	Acustomer may report the malfunction indicator lamp (MIL) is illuminated, lack of power and sometimes noise coming from the engine bay. The stored diagnostic trouble code (DTC) points to "turbocharger under-boost" which results from a failure of the Turbo-Exhaust Manifold. 1113 Jaguar Land Rover introduced a brazed scroll manifold which at high time in service is starting to disintegrate. The root cause being a combination of thermal fatigue and vibrations which will make the joints loose.			18067	5781
	The part numbers 11157640285, 11158637873 and 11158647961 relate to the vent pipe PCV. Part number 11157640285 with index 01 has been used in production between 07/12 and 01/14. Between 02/2014 and 04/14 a modified component with same part number but different index (index 03) has substituted component with index 01 as production and as replacement part. This new part exhibits a notched ring, which should stabilize some due to temperature impact fragile areas of the vent pipe. Between 05/14 and 06/15 an additional hardware improvement in the welding geometry of the vent pipe has been introduced in production and as replacement part (part number 11158637873). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. This new component with part number 11158647961 is used since 07/15 in production and as current replacement part for vehicles produced before. Analysis have shown that in about 90% the original assembled part with part number 11157640285 has been replaced because of leakage problems caused by fragile parts of the vent pipe. These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. Since the usage of part number 11158637873 in 05/14, these problems could be reduced to 60% valid replacements. A complete elimination of the hardware issue could be fulfilled with introduction of the new material used with part number 11158647961 beginning with 07/15. The component vent pipe PCV with part number 11158647961 therefore is robust, has/ had no malfunction and is/ was working properly. Considering the afore mentioned explanations the Weibull results and valid fail values listed in this report relate to the less-robust component vent pipe PCV with part numbers 11157640285 and 11158637873.	6/30/2012	5/31/2013	39763	2400

Between 05/14 and 06/15 an additional hardware improvement in the welding geometry of the vent pipe has been introduced in production and as replacement part (part number 11158637873). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. This new component with part number 11158647961 is used since 07/15 in production and as current replacement part for vehicles produced before. Analysis have shown that in about 90% the original assembled part with part number 11157640285 has been replaced because of leakage problems caused by fragile parts of the vent pipe. These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. Since the usage of part number 11158637873 in 05/14, these problems could be reduced to 60% valid replacements. A complete elimination of the hardware issue could be fulfilled with introduction of the new material used with part number 11158647961 beginning with 07/15. The component vent pipe PCV with part number 11158647961 therefore is robust, has/ had no malfunction and is/ was working properly. Considering the afore mentioned explanations the Weibull results and valid fail values listed in this report relate to the less-robust component vent pipe PCV with part numbers 11157640285 and 11158637873.	6/30/2012	5/31/2013	39763	2400
	The part numbers 11157640285, 11158637873 and 11158647961 relate to the vent pipe PCV. Part number 11157640285 with index 01 has been used in production between 07/12 and 01/14. Between 02/2014 and 04/14 a modified component with same part number but different index (index 03) has substituted component with index 01 as production and as replacement part. This new part exhibits a notched ring, which should stabilize some due to temperature impact fragile areas of the vent pipe. Between 05/14 and 06/15 an additional hardware improvement in the welding geometry of the vent pipe has been introduced in production and as replacement part (part number 11158637873). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. 	<p>Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in regions with high ambient temperatures (+100 deg. F). The vehicles are able to be restarted.</p> <p>1150 Nissan has investigated and found that this issue is caused by the ECM miscalculating the amount of purge gas inside the evap canister in extreme hot weather conditions. When this occurs, excess gas enters the engine causing the engine to run rich and hesitate/stop.</p> <p>1151 High pressure fuel pumps, part numbers 95811031601, 95811031602 and 95811031603, are being replaced in the field for MIL illumination and customer complaints of hesitation when driving. The most frequent faults stored are P008700, P217700 and P229400.</p> <p>1152 High pressure fuel pumps, part numbers 95811031601, 95811031602 and 95811031603, are being replaced in the field for MIL illumination and customer complaints of hesitation when driving. The most frequent faults stored are P008700, P217700 and P229400.</p> <p>1153 Spark plugs (Part Number 99917023390) are being replaced in the field for illuminating the MIL. Misfire codes are usually stored, which prompts immediate customer action.</p> <p>1154 Oil line restrictors are being replaced in the field for MIL illumination. Fault codes most frequently stored are P1372 for valve lift and P000A, P000C camshaft slow response for bank 1 and bank 2, respectively.</p>	6/13/2013	8/22/2014	3038 14489 10729 12718 3174	0 56 77 60 42
	<p>Post catalyst oxygen sensors (part numbers 9A790626550 and 9A790626551) are being replaced in the field for MIL illumination. Fault codes most frequently stored are P227000 and/or P227200: "Oxygen Sensor bank 1 and/or 2 Signal Stuck Lean"</p> <p>1155 Analysis shows that the reference air canal of the sensor was contaminated with Silicone (SiO2) that originated from the cable protection sheath. The sheath was changed to an alternative material. Analysis also showed that the temperature of the sensor was too low during diagnosis, so the heating model of the engine ECU software was changed.</p>			3107	261
	<p>The subject vehicles are equipped with a 3.5L V6 2GR-FSE gasoline engine with an intake port injection system containing two fuel pulsation dampers. The diaphragm material in the fuel pulsation dampers may harden over time due to a chemical process involving amine in the fuel, higher ethanol content in fuels used in countries such as the U.S., Canada, and China, and high temperatures. If this were to occur, cracks could develop on the diaphragm, causing fuel to leak. A fuel leak in the presence of an ignition source can increase the risk of a vehicle fire.</p> <p>1156</p>			1403	1403

1160	<p>Inductive pickup/transmitters (part number 7PP905381A and 7PP905381B) are being replaced in the field for illuminating the MIL. Customers have also complained of "Engine reduced power" warnings and no starts. The inductive pickup/transmitter is responsible for communicating crankshaft position measurements to the vehicle's DME to determine ignition and fuel delivery timing. Inaccurate position data causes inefficient combustion which could affect vehicle emissions. Analysis shows that there was an issue with the increment and decrement counter for crankshaft sensor synchronization in the Engine ECU software. The software was updated.</p>	2/6/2013	5/27/2014	4166	69
1161	<p>Hyundai Motors America, Inc. is conducting an important Product Improvement Campaign to perform a software update on 2015 MY Sonata vehicles equipped with 2.4L 2.0L GDI engines to protect the engine from connecting rod bearing damage. The update will only involve the addition of newly developed computer software for the Engine Control Unit (ECU). Hyundai recently developed a Knock Sensor Detection System (KSDS) that detects vibrations indicating the onset of connecting rod bearing wear in the engine. The KSDS is designed to alert a vehicle driver at an early stage of bearing wear before the occurrence of engine damage including engine failure.</p>			135809	0

The update will only involve the addition of newly developed computer software for the Engine Control Unit (ECU). 1164 Kia recently developed a Knock Sensor Detection System (KSDS) that detects vibrations indicating the onset of connecting rod bearing wear in the engine. The KSDS is designed to alert a vehicle driver at an early stage of bearing wear before the occurrence of engine damage including engine failure.			62254	0
	Kia Motors America, Inc. is conducting an important Product Improvement Campaign to perform a software update on 2015 MY Sorento vehicles equipped with 2.4L GDI engines to protect the engine from connecting rod bearing damage. The update will only involve the addition of newly developed computer software for the Engine Control Unit (ECU). 1165 Kia recently developed a Knock Sensor Detection System (KSDS) that detects vibrations indicating the onset of connecting rod bearing wear in the engine. The KSDS is designed to alert a vehicle driver at an early stage of bearing wear before the occurrence of engine damage including engine failure.			62254	0
	Customer Complaint: MIL on, and whistling sound from engine compartment. Component: PCV Valve/Oil Separator Production Part Number: 079103542B Warranty Replacement Part Number: 079103542E DTC present: - P2297 (Intake Air System Leak - adaption value monitoring) - P0507 (Idle Control System - RPM Higher than expected) Analysis reflects part number 079103542B 1166 Analyzed components showed a cracked membrane and/or broken check valve within the module of crankcase ventilation system.			4827	262
	Customer Complaint: MIL on, and whistling sound from engine compartment. Component: PCV Valve/Oil Separator Production Part Number: 079103542B Warranty Replacement Part Number: 079103542E DTC present: - P2297 (Intake Air System Leak - adaption value monitoring) - P0507 (Idle Control System - RPM Higher than expected) Analysis reflects part number 079103542B 1167 Analyzed components showed a cracked membrane and/or broken check valve within the module of crankcase ventilation system.			4827	262
	The affected part number 13537805423 relates to the PRESSURE ACCUMULATOR (FUEL RAIL). Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2015 Test Group FBMXV03.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils). Please see corresponding EDIR-OF-N57/047-0267. In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component PRESSURE ACCUMULATOR (FUEL RAIL) is/was working properly and has/had no malfunction. 1169 On the affected vehicles, in-tank fuel pump module electrical connector contacts were manufactured to larger than intended dimensional tolerance. In certain cases a smaller mail pin can result in an intermittent electrical connection between in the in-tank fuel pump module and the wiring harness. 1170 In certain vehicles, fuel in the high pressure fuel pump may hydraulically force open the pressure regulator valve prior to the control system commanding this valve to open. If this occurs it is possible for this valve movement to induce a back-EMF voltage into the engine control module circuit. The engine control module detects such a change in voltage as a control circuit fault and, then 1171 DAG has determined that insufficient robustness with regard to environmental impacts, such as increased moisture, could lead to electrical failures of the differential pressure sensor. As a result, the fault is stored in the engine control unit and the engine diagnostics warning lamp (MIL) is activated. 1172 DAG has determined that insufficient robustness with regard to environmental impacts, such as increased moisture, could lead to electrical failures of the differential pressure sensor. As a result, the fault is stored in the engine control unit and the engine diagnostics warning lamp (MIL) is activated. 1173 DAG has determined that insufficient robustness with regard to environmental impacts, such as increased moisture, could lead to electrical failures of the differential pressure sensor. As a result, the fault is stored in the engine control unit and the engine diagnostics warning lamp (MIL) is activated. 1174 DAG has determined that insufficient robustness with regard to environmental impacts, such as increased moisture, could lead to electrical failures of the differential pressure sensor. As a result, the fault is stored in the engine control unit and the engine diagnostics warning lamp (MIL) is activated. 1175 DAG has determined that insufficient robustness with regard to environmental impacts, such as increased moisture, could lead to electrical failures of the differential pressure sensor. As a result, the fault is stored in the engine control unit and the engine diagnostics warning lamp (MIL) is activated.	6/30/2014	5/31/2015	1505 22833 78458 12104 2902 5566 6539 15006	348 32 54 1423 150 61 288 1204

1197	<p>The subject vehicles are equipped with a 3.5L V6 2GR-FSE gasoline engine with an intake port injection system containing two fuel pulsation dampers. The diaphragm material in the fuel pulsation dampers may harden over time due to a chemical process involving amine in the fuel, higher ethanol content in fuels used in countries such as the U.S., Canada, and China, and high temperatures. If this were to occur, cracks could develop on the diaphragm, causing fuel to leak. A fuel leak in the presence of an ignition source can increase the risk of a vehicle fire.</p>			773	773

1271	<p>Recent fleet testing of a 3.3L T-GDI engine indicated that performance of N2O control may behave differently than expected. It has not been confirmed that this is a general issue related to the overall performance of the 3.3.T-GDI engine, or an individual performance of the single engine. However, current analysis has raised a possibility that unexpected heat loss due to the turbocharger performance may alter the expected chemical composition and transformation of N2O gas development and control. Additional investigation is underway.</p> <p>Hyundai has not determined that a defect exists at this time, and is not aware if, or of, a specific number of customer vehicles or engines that have experienced this issue in the field. Hyundai's experience to date is limited to one fleet vehicle and its internal review of the N2O chemistry and performance. However, in an abundance of caution, Hyundai is issuing this EDIR as it is considered possible that such performance may occur in the field under some typical driving conditions.</p>			2481	0

	Some 2018 model year Kia Stinger, Cadenza, 2019 model year Sedona, Optima, Sorento vehicles have the misprinted on the engine oil filler caps. Original viscosity is 5W-30, but 0W-30 mark was printed. The supplier made a mistake in selection of the printing plate. 1286 Kia will replace the misprinted filler caps with the right ones. 1287 On some MY2018 Nissan Murano vehicles, a material handling error resulted in MY2017 VECI labels being installed in error.			307 42	307 42
	DAG has determined that an engine misfiring and irregular engine running condition can be caused by either a heavily loaded vehicle operation with a cold engine or by a pre-ignition condition with strong pressure peaks. 1288 This condition is caused by a coking of the spark plug or a breakage of the spark plug insulator, either of which can lead to short-term misfire. In such case, the OBD system detects the misfire, illuminates the MIL and switches off the injection of the affected cylinder.	5/31/2015	5/30/2016	3698	143
	The affected part number 13518604232 relates to the component HIGH PRESSURE FUEL PUMP. Analysis have shown that in about 81% of all cases the high pressure pump has been replaced due to a correct fault code entry and MIL illumination, identifying the malfunction of that specific component. Deterioration of gasoline filter materials emitting small filter particles, lead to a blockage of the high pressure valve. The deterioration of the gasoline filter could be traced back to high temperature conditions and low gasoline quality respectively inadequate gasoline additives. Beginning with 12/2015 a new filter material (PPEEK?? instead of PA) for the filter was introduced in production and services. 1289	2/28/2014	5/31/2015	11445	1259

	<p>The affected part number 13538594893 relates to the Fuel Line to High Pressure Pump. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2015 Test Group FBMXV02.0N47, BMW decided a warranty extension to full useful life (10 years / 120.000mils) (please note that the corresponding FRB (equivalent to FRB F-06.2.0-9) will be submitted after the reporting threshold >4% and >50 cases is exceeded). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW's services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component Fuel Line to High Pressure Pump is/was working properly and has/had no malfunction.</p>				
1299		6/30/2014	5/31/2015	3701	282
1300	The OBD system may falsely detect a malfunction of the "Shift by wire Control (incorrect parking lock indication)" when driver push "parking" button in a certain condition.	5/1/2018		27242	1
1301	The OBD system may falsely detect a malfunction of the "Shift by wire Control (incorrect parking lock indication)" when driver push "parking" button in a certain condition.	8/29/2017	4/19/2018	692	0
1302	The OBD system may falsely detect a malfunction of the "Shift by wire Control (incorrect parking lock indication)" when driver push "parking" button in a certain condition.	5/10/2016	9/1/2017	31969	0
1303	The OBD system may falsely detect a malfunction of the "Shift by wire Control (incorrect parking lock indication)" when driver push "parking" button in a certain condition.	3/1/2017	9/19/2017	2114	0
	<p>Some 2015-2016 MY 3.6L Dodge Charger and Chrysler 300 fleet vehicles are experiencing replacements of the left side fuel pump module.</p> <p>A FCA US review of 58 warranty claims found that of the 58 fuel pump/level units replaced for the following reasons: 4 (6.9%) due to a no start condition, 48 (82.8%) due to a fuel smell or leak at the flange and 2 (3.5%) due to a fuel level sensor issue. The remaining 4 (6.9%) units were right side fuel pump/level unit modules.</p> <p>The two primary types of failure are caused by a melted electrical connector which is part of the top flange and a failed capacitor inside the left fuel pump module. First, an internal capacitor within the left fuel pump module may have been damaged during the fuel pump assembly process which results in a vehicle no start.</p>				
1304	Second, the majority of these vehicles are police vehicles. A combination of the extended run time of these vehicles causes temperature to increase along with temperature generated by the flow of current to the fuel pump. This is causing the electrical connector/flange to melt and allow fuel vapor to escape.			1944	207

	The affected part number 13538594893 relates to the Fuel Line to High Pressure Pump. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2015 Test Group FBMKV02.0N47, BMW decided a warranty extension to full useful life (10 years / 120.000mi). Please see corresponding EDIR-QF-NS7/N47-Q267. In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mi). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component Fuel Line to High Pressure Pump is/was working properly and has/had no malfunction.

	-Complaint: MIL and/or Runs Rough -Cause: ECM Software 1)Diagnostic signal for Knock Sensor 2 is too low/high and unauthorized error messages are generated. 2)With dynamic load changes misfires can occur (without DTCs). 3)Oil level warning lamp is illuminated (too high). 4)Misfire in COD operation (Cylinder On Demand). 5)The stopping time of the coolant pump may be, under certain conditions, too short to prevent cooling system damage. Correction: updated ECM software 1)The knock sensor diagnostic has been optimized (data adjustment). 2)The combustion is adapted and optimized in the engine control. 3)The threshold for oil level warning is too small. Consequently the threshold for the oil level warning has been increased and adapted. The request for warming up occurs earlier. 4)The running time while in COD mode is reduced. To prevent misfires when switching to full engine operation, the parameters have been adjusted. 5)The stopping time of the coolant pump was adjusted to prevent damage to the cooling system. 1328	<p>Based on manufacturer technical/data analysis, BMW detected a software failure implemented on all BMW PHEV vehicles (330e, 530e sDrive, 530e xDrive and 740e xDrive) produced between 07/01/2016 by 08/31/2018. Failure description: In case a limp home mode (full throttle operation instead of variable valve lifting/timing) is active due to a fault in the VVT (valvetronic) system, a parallel existing software failure became also active with influence on the Cold Start Emission Reduction Strategy (CSERS) and thus causing an HC emission deterioration. In more detail, during the catalytic converter warmup phase after a cold start, the warming up rate of the catalytic converter while engine warmup is reduced so that the operating temperature of the catalytic converter is reached with a delay (1-2 minutes instead of 30-40 seconds).</p>	6/30/2016	6/29/2017	3997	3997
1329	<p>Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire. If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs.</p> <p>These can include: ?Coolant loss with Check-Control-Indication ?Loss of power with ? if applicable ? Check-Control-Indication (depending on grade of damage) ?Smell of exhaust gas ?Unusual noise from the engine compartment ?Smoke development from the engine</p> <p>In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740Li xDrive 535d and 535d xDrive) produced between 07/01/2013 and 05/31/2017</p>	2/28/2014	6/29/2015	1505	1505

1349	<p>Daimler AG has determined that on certain GLE-Class (platform 166), SL-Class (platform 172), C-Class (platform 204), E-Class (platforms 207, 212), S-Class (platforms 216, 217, 221, 222), CLS-Class (platform 218), SL-Class (platform 231), R-Class (platform 251), GLC-Class (platform 253), G-Class (platform 463) vehicles with 4-, 6- and 8-cylinder gasoline engines catalyst heating might not be active in one special use case. The issue only occurs when the following unusual circumstances occur in combination: The engine is turned off after a driving cycle where it was fully warmed up. At the next engine-start / driving cycle the engine is started and turned off after no more than 2 seconds of operation. At the subsequent engine start / driving cycle catalyst-heating is not activated. In this case, due to a delayed heating up of the catalyst, an impact on emissions cannot be ruled out.</p>			8606	0

1352	<p>Daimler AG has determined that certain MY12-18 vehicles of diverse platforms could experience a software error. If a shortcut occurred within the injector while the engine was switched off, the failure code for this short cut would not be stored and the MIL would not be activated. However, in case of a confirmed shortcut, the MIL would be activated by a subsequent failure mechanism (misfire detection) and the workshop would replace the correct part. Based on a field claim analysis of potentially affected vehicles worldwide, the probability of occurrence of the described failure is lower than 0.00018 %.</p>			3803	0

1363					
1364	Avapor lock condition in the fuel delivery system can occur after extended periods of engine idle when the ambient temperature is greater than 100 degF. Under these conditions the fuel flow rate from the in-tank mounted fuel pump may be sufficiently low that the liquid fuel can vaporize in the fuel delivery system and fuel pump resulting in pump cavitation or stalling.			8951	18
	<p>The affected part number 13537805423 relates to the FUEL RAIL (PRESSURE ACCUMULATOR). Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2017 Test Group HBMT03.0N37, a final decision based on the final analysis results is expected in Q1/2019 (e.g. if a warranty extension to full useful life (10 years / 120.000mi; equivalent to EDIP OE N57-Q177) or any other measurement (as e.g. a service campaign with replacement of component high pressure fuel pump at next service visit) will be decided). In case the high pressure fuel pump is pre-damaged or already malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mi). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FUEL RAIL (PRESSURE ACCUMULATOR) is/was working properly and has/had no malfunction.</p>	7/31/2016	7/31/2017	2614	544
1365					
	<p>The affected part number 17117537292 relates to the RADIATOR W/DORS. Analyses have shown that in about 80% of all cases this component was replaced in service due to leakages. In the other about 20% of all cases a malfunctioning DORS sensor (e.g. electrical failure including fault code storage and MIL illumination) was the reason to replace the complete DORS system including also the DORS radiator although the coated DORS radiator itself was not defective and met still the functional requirements (convert ozone in oxygen).</p>	8/31/2009	1/31/2010	19097	1184

	Q	R	S	T	U
	The affected part number 13537823400 relates to the FRONT FUEL RETURN LINE [RETURN PIPE]. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2017 Test Group HBMXT03.0N57, a final decision based on the final analysis results is expected in 01/2019 (e.g. if a warranty extension to full useful life (10 years / 120.000mils; equivalent to FIR F-0E-3.0-11) or any other measurement (as e.g. a service campaign with replacement of component high pressure fuel pump at next service visit) will be decided). In case the high pressure fuel pump is pre-damaged or already malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FRONT FUEL RETURN LINE [RETURN PIPE] is/was working properly and has/had no malfunction.	7/31/2016	7/31/2017	2614	544
1309	Complaint: MIL on without stored trouble codes. DTCs Present: No DTCs present Component: Procedure documents for flashing ECM Part Number - Production: Not Applicable Part Number - Replacement: Not Applicable Part Number - Analysis: Not Applicable Analysis: Vehicles found failing IM inspection. The affected vehicles had an incorrect procedure performed when flashing of the engine software of the engine ECU. An improper procedure may result in a system failure that does not store trouble codes after each key off cycle and consequently the warning lamps indicating system failures will cease to illuminate.			264	264
1370	Complaint: MIL on without stored trouble codes. DTCs Present: No DTCs present Component: Procedure documents for flashing ECM Part Number - Production: Not Applicable Part Number - Replacement: Not Applicable Part Number - Analysis: Not Applicable Analysis: Vehicles found failing IM inspection. The affected vehicles had an incorrect procedure performed when flashing of the engine software of the engine ECU. An improper procedure may result in a system failure that does not store trouble codes after each key off cycle and consequently the warning lamps indicating system failures will cease to illuminate.			158	158
1371	The affected part number 16117260648 relates to the FUEL PUMP [DELIVERY MODULE]. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMXV03.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils) (please note that the corresponding FIR (equivalent to FIR F-0E-3.0-11) will be submitted after the reporting threshold >4% and >50 cases is exceeded).	6/30/2015	9/30/2016	1209	359
1372	The lower lid within the fuel filler neck of the cap less unit does not close properly.			41	41
1373	The lower lid within the fuel filler neck of the cap less unit does not close properly.			41	41
1374	Daimler AG has determined that certain GLE-Class vehicles (166 platform) with 8-cylinder gasoline engine (M278) might experience a software error. For a plausible test result of the monitor of the downstream oxygen sensor, the monitor is intended to be aborted as soon as driving conditions (load) are no longer constant. However, the exit conditions of the monitor on these vehicles might not be reached.			690	8
1375	Daimler AG has determined that certain GLE-Class vehicles (166 platform) with 8-cylinder gasoline engine (M278) might experience a software error. For a plausible test result of the monitor of the downstream oxygen sensor, the monitor is intended to be aborted as soon as driving conditions (load) are no longer constant. However, the exit conditions of the monitor on these vehicles might not be reached.			21712	669
1376	Based on manufacturer technical/data analysis, BMW detected a software failure implemented on all BMW/MINI vehicles with Bosch Engine Control Module MEVD17.2.3 produced between 03/01/2018 by 07/31/2018. Failure description: The locking of the ECM is implemented to avoid the manual deleting of permanent diagnostic trouble codes (DTC). If the locking is not active, (permanent) DTCs could be deleted manually with a diagnostic tool. In the affected ECMs/Vehicles the locking of ECM is not active.	2/28/2018	6/29/2019	850	850
1377	Based on manufacturer technical/data analysis, BMW detected a software failure implemented on all BMW/MINI vehicles with Bosch Engine Control Module MEVD17.2.3 produced between 03/01/2018 by 07/31/2018. Failure description: The locking of the ECM is implemented to avoid the manual deleting of permanent diagnostic trouble codes (DTC). If the locking is not active, (permanent) DTCs could be deleted manually with a diagnostic tool. In the affected ECMs/Vehicles the locking of ECM is not active.	2/28/2018	2/27/2019	6144	6144
1378	The OBD system may falsely detect a malfunction of the P0716 "Input speed sensor performance check" in a certain condition.	2/2/2015	11/7/2016	134326	314
1379	The OBD system may falsely detect a malfunction of the P0716 "Input speed sensor performance check" in a certain condition.	7/14/2014	9/17/2015	37330	22
1380	The OBD system may falsely detect a malfunction of the P0716 "Input speed sensor performance check" in a certain condition.	7/15/2016	3/27/2017	11447	30
1381	In certain vehicles a refrigerant leak may occur at the receiver/dryator plug on the air conditioning system condenser. Certain vehicles have been identified with an o-ring seal on this plug that is not within dimensional specifications and may not properly seal at low ambient temperatures.			42244	11
1382	In certain vehicles a refrigerant leak may occur at the receiver/dryator plug on the air conditioning system condenser. Certain vehicles have been identified with an o-ring seal on this plug that is not within dimensional specifications and may not properly seal at low ambient temperatures.			4697	16

1402	Due to inappropriate calibration of the PCM and TCM, engine oil may be diluted with fuel when short trip driving operation is repeated during winter season in cold weather (low engine oil temperature condition). After that, when fully warmed up the diluted fuel in the engine oil may evaporate rapidly and the MIL may illuminate	8/2/2017		31406	8
	Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2018 Test Group JBMXT03.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils) (please see EDIR-01-N57-0325). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FUEL PUMP (DELIVERY UNIT W/ IN-TANK PUMP RIGHT) is/was working properly and has/had no malfunction.	8/31/2017	7/30/2018	3366	562
	The affected part number 11618507335 relates to the INTAKE MANIFOLD GASKET (PROFILE-GASKET). Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2018 Test Group JBMXT03.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils) (please see EDIR-01-N57-0325). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component INTAKE MANIFOLD GASKET (PROFILE-GASKET) is/was working properly and has/had no malfunction.	8/31/2017	7/30/2018	3366	562
1405	DAG has identified three main root causes which may cause failure of the up-stream and down-stream NOx sensors. 1) Oscillating signal: An increased resistance in the air-reference-electrode of the sensor may lead to increased Nerst voltage which may cause the modulator to oscillate. This situation leads to a permanent deterioration of the sensor signal quality. 2) Crack due to thermal stress: A crack in the ceramic housing of the sensor may lead to a permanent deterioration of the sensor signal quality. 3) Contamination: Contamination of the sensor with oil or dirt may lead to a permanent deterioration of the sensor signal quality.			909	537
1406	DAG has identified three main root causes which may cause failure of the up-stream and down-stream NOx sensors. 1) Oscillating signal: An increased resistance in the air-reference-electrode of the sensor may lead to increased Nerst voltage which may cause the modulator to oscillate. This situation leads to a permanent deterioration of the sensor signal quality. 2) Crack due to thermal stress: A crack in the ceramic housing of the sensor may lead to a permanent deterioration of the sensor signal quality. 3) Contamination: Contamination of the sensor with oil or dirt may lead to a permanent deterioration of the sensor signal quality.			201	72
1407	Some 2014 MY Jeep Cherokee (KL) vehicles equipped with a 3.2L engine (Sales code: EHB) may experience a loss of motive power while driving due to a commanded shift to neutral, most likely at highway speeds. This event most frequently occurs during the 7th-8th gear shift due to a sticking clutch valve that will prevent the dog clutch from releasing. If the vehicle should experience this condition, the vehicle should be towed to a BMW service center for diagnosis and repair.			93211	3381
	The affected part number 13537823400 relates to the FUEL RETURN LINE. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2018 Test Group JBMXT03.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils) (please see EDIR-01-N57-0325). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FUEL RETURN LINE is/was working properly and has/had no malfunction.	8/31/2017	7/30/2018	3366	552

	<p>If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine N74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.</p>	6/30/2017	6/29/2018	6869	6869

	<p>If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine N74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.</p>	2/28/2019	5/7/2019	21	21
	1410 Some 2019 MY 2.0L GTDI and 2.7L Nautilus, 2019 2.3L GTDI and 5.0L Mustang and 3.5L GTDI Navigator vehicles were built with an instrument cluster that may not display required telltales including the malfunction indicator light.			1430	1430

	<div>Analysis determined software list above calibrations within this report have one of the following concerns:</div> <div>-Software designed for other Model - Software was intended for another model</div> <div>-No Information Available - Unique software on a low number of vehicles that are not possible to analyze</div> <div>-Possible CO2 Impact - Software designed and certified for a model year but that was then applied to a different model year without a field fix. 	<p>The affected part number 16127205304 relates to the REAR FUEL FEED LINE. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMXV03.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils) (Please see corresponding EDIR-OG-N57/N47-0311) will be submitted after the reporting threshold >4% and >50 cases is exceeded). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component REAR FUEL FEED LINE is/was working properly and has/had no malfunction.</p> <p>On some 2019 Nissan Altima vehicles, the fuel pump lock ring that secures the fuel pump module to the fuel tank may have been installed incorrectly during production. More specifically, the lock ring may not have been completely engaged during re-installation following offline rework at the supplier. If the fuel pump lock ring is r</p>	6/30/2015 2/20/2019	10/30/2016 3/1/2019	1209 8100	298 347

	<p>The affected part numbers 13907614013 (used for model MINI Cooper Clubman) and 13907621174 (used for models MINI Cooper and MINI Convertible) relate to the FUEL TANK BREATHER VALVE. Analyses have shown, that in 100% of all cases one of the following two different hardware failures could cause the malfunctioning tank breather valve, which are both detected by the OBD system (fault code entry including MIL illumination). Failure #1 (Knobs failure mode): The rubber structure of the knobs pressed in the hole of the valve bumper could crack in the area between chamfer and hole and in the following could detach and get lost in the backside. Due to the missing rubber structure there is a metal to metal contact in the fuel tank breather valve, which could result in a blocked valve and could lead to a too lean fuel mixture, which is detected by the OBD. Failure #2 (Retractable membrane): Due to failures in the production process the retractable membrane (plastic material) of the non-return valve could brake completely. This malfunction could be caused either by an extruding failure or by a pre-damage of the membrane due to a ridge on the seat engaging surface of the anker. For vehicles with one fuel tank breather valve this malfunction (broken membrane) will be detected by the OBD as small leakage, for vehicles with two valve as a leakage of the second purge line.</p>	6/30/2015	6/29/2016	16499	4950

This pre-stress, in combination with normal vehicle use, may lead to premature component malfunction. Additionally, a deficiency in the Engine Control Module (ECM) calibration may lead to the heated sensing element experiencing thermal shock following water contact leading to sensor malfunction.</p> <p>Both conditions cause the Malfunction Indicator Lamp (MIL) to be illuminated and diagnostic trouble codes (DTC?s), relevant to the post-catalyst heated oxygen sensors, to be stored in the Engine Control Module (ECM), also known as the Powertrain Control Module (PCM).</p>			22809	6546
1624	<p>During the assembly of certain vehicle fuel tanks, a wire, that is internal to the fuel tank, was incorrectly routed in a way that it is possible that the wire can interfere with movement of the fuel level sensor float. If this were to happen the fuel gauge could read less than the actual fuel level.</p>			44	44
1625	<p>In certain vehicles the ECM does not properly respond to test tool requests for the Calibration Verification Numbers (CVN).</p>			44	44

	Some 2018 model year Kia Stinger, Cadenza, 2019 model year Sedona, Optima, Sorento vehicles have the misprinted on the engine oil filler caps. Original viscosity is 5W-30, but 0W-30 mark was printed. The supplier made a mistake in selection of the printing plate. 1651 Kia will replace the misprinted filler caps with the right ones.			714	714
	Some 2016 model year Sonata PHEV(s) have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P0445 (Evap. system large leak). According to the warranty parts investigation of the 18 evap. leak check modules(ELCM) in the troubled vehicles, all of the parts were operating perfectly in normal condition not only the appearance but the performance. It is Hyundai's assessment that ELCMs and fuel filler necks were replaced at the same time to fix the P0455 MIL. We found that the both parts were replaced in the same vehicles. The vehicles might have issue that the fuel filler cap was not secured to the filler neck because inner diameter of fuel filler neck was narrower than the spec. The fuel filler cap could be stuck in the filler neck before being sealed completely, and it could cause a large leak path. 1652 1653 Kia has received some owners comments regarding shift quality of automatic transaxles on some of the 2017MY Sportage equipped with 2.4L GDI engines. In order to improve the quality of shifts, Kia is improving the shift feel with calibration modification of the transmission. 1654 Kia has received some owners comments regarding shift quality of automatic transaxles on some of the 2017MY Sportage equipped with 2.4L GDI engines. In order to improve the quality of shifts, Kia is improving the shift feel with calibration modification of the transmission. 1655 Some plastic fuel tanks were incorrectly manufactured with insufficient adhesion around the fuel tank vapor return joint. The weld joint may fail between the fuel tank and the vapor return joint and may lead to a fuel leak. 1656 Some 2014-2016 vehicles equipped with a 3.6L Pentastar Classic engine (EHB) may have rocker arm axle/bearings that wear prematurely, causing the rocker arm to function inappropriately. If this should occur, a MIL is illuminated and P-codes P0301-P0306, for misfire, are stored. 1657 Some 2014-2016 vehicles equipped with a 3.6L Pentastar Classic engine (EHB) may have rocker arm axle/bearings that wear prematurely, causing the rocker arm to function inappropriately. If this should occur, a MIL is illuminated and P-codes P0301-P0306, for misfire, are stored. 1658 Some 2014-2016 vehicles equipped with a 3.6L Pentastar Classic engine (EHB) may have rocker arm axle/bearings that wear prematurely, causing the rocker arm to function inappropriately. If this should occur, a MIL is illuminated and P-codes P0301-P0306, for misfire, are stored. 1659 Some 2014-2016 vehicles equipped with a 3.6L Pentastar Classic engine (EHB) may have rocker arm axle/bearings that wear prematurely, causing the rocker arm to function inappropriately. If this should occur, a MIL is illuminated and P-codes P0301-P0306, for misfire, are stored.			1032 69077 28666 119 140335 367386 258783 142871	101 2 2 1 1460 4404 3196 248
	When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. If this occurs, air flow through the evaporative system may be impacted such that excessive negative pressure is created in the fuel tank. This can cause deformation of the fuel tank, which can lead to fuel tank cracks. 1660	6/1/2010	5/31/2011	6120	6120

1713	Certain 2018MY Toyota/Lexus vehicles may exhibit a condition in which the rear O2 sensor monitor may not detect a slow response malfunction within the engine exhaust system at the time of fuel cut operation. The Engine Control Module/ECM logic has been modified to prevent misdetection.				
	2012~2016 model year KIA Souls equipped with 1.6L engine have experienced safety issue of vehicle fire . According to the investigation, overheating of a catalyst converter which is caused by inaccurate Catalytic Overheating Protection(COP)logic could be a cause of this issue. High exhaust gas temperature could damage the catalytic converter and it can cause abnormal combustion and damage pistons and connecting rods. A failed connecting rod can pierce the engine block and cause oil leaks that can cause fires. To correct this problem, Kia will reprogram the ECU data with improved COP condition to protect the catalyst converter and replace the catalytic converter which vehicles have a malfunction indicator light (MIL) illumination with a diagnostic trouble code P0420.			70018	2233

	Daimler has identified two main root causes, which may lead to replacement of the pressure gauge converter. 1)The diagnostic thresholds of the pressure gauge converter sensor might be calibrated too sensitively/narrowly. Therefore, in certain circumstances, an error of the pressure gauge converter sensor could be set and the MIL could be activated erroneously. In this case, the sensor is actually not malfunctioning. 2)An incorrect position of the gold plates within the pressure gauge converter sensor can lead to internal short circuits to ground. Therefore, an error of the pressure gauge converter sensor could be set and the MIL could be activated.			9441	108
1716					
	The S 550 is equipped with an electrical pump in the cooling circuit that will be commanded on if there is a cabin heating request. When this pump is activated, an unintended coolant backflow through the engine radiator and an additional radiator in the wheel housing might occur. Under very low ambient temperature conditions (below 20°F) in conjunction with specific driving conditions (constantly very low engine load request) and the engine thermostat commanded closed, this possible coolant backflow leads to a temperature drop in the engine cooling circuit. The OBD thermostat monitor, which compares the measured coolant temperature with a modelled target value, misinterprets this coolant backflow as a stuck open thermostat because the actual coolant temperature is significantly lower than expected. The MIL will falsely illuminate if this scenario happens in 2 consecutive engine warm-up cycles in which the OBD-related thermostat monitor is running.

	<p>The affected part number 11617801943 relates to the VENTURI TO THROTTLE O-RING (PROFILE GASKET). Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMW03.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils) (Please see corresponding EDIR-OG-N57/N47-0311) will be submitted after the reporting threshold >4% and >50 cases is exceeded). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component VENTURI TO THROTTLE O-RING (PROFILE GASKET) is/was working properly and has/had no malfunction.</p>	6/30/2015	10/30/2016	1209	298
1737	<p>Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire.</p> <p>If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs.</p> <p>These can include:</p> <ul style="list-style-type: none">?Coolant loss with Check-Control-Indication?Loss of power with ? If applicable ? Check-Control-Indication (depending on grade of damage)?Smell of exhaust gas?Unusual noise from the engine compartment?Smoke development from the engine <p>In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740iLd xDrive 535d and 535d xDrive) produced between 07/01/2013 and 05/31/2017</p>	2/28/2014	6/29/2015	1505	1505
1739	<p>In Voluntary Safety Recalls U60, U62, U64 and U65, some 2018 3.6L Jeep Wrangler (?L1??), Chrysler Pacifica (?R1U??), Jeep Grand Cherokee (?WK??), Dodge Durango (?WD??) and 6.4L Dodge Challenger (?LA??) and Dodge Charger (?LD??) vehicles contain a software vulnerability that may result in the inability to cancel cruise control (?CC??) during a CAN-C twisted pair short. In this condition the vehicle may continue at a steady speed or accelerate.</p> <p>The vehicles noted above within these Voluntary Safety Recalls may have calibrations with the Cold Start Emissions Reduction Strategy (CSERS) diagnostic, for ignition timing performance, which is inadvertently disabled when the engine oil temperature is below 10°C.</p>			51642	51642
	<p>The customer may experience Malfunction Indicator Light (MIL) illumination with Diagnostic Trouble Code (DTC) P2002, indicating low Diesel Particulate Filter (DPF) Efficiency, stored within the Engine Control Module (ECM). Unexpected high soot loading within the DPF may lead to overheating during a regeneration event which causes the ceramic internal monolith to crack.</p> <p>1740 Root cause has been determined to be an overly cautious coolant temperature set point of 50 degrees C before the monitoring routine to measure pressure drop across the DPF is activated.</p> <p>1741 The Throttle Valve Actuator and Variable Swirl Valve Actuator Monitoring are monitoring continuously for a governor deviation of the throttle valve actuator or swirl valve actuator. For a limited time of ~1s the monitors could come to a false pass result, due to the signal processing within the monitor. Dependant on the customer behaviour (i.e. turning the engine off within the limited ~1s</p> <p>1742 Some 2011~2016 model year Kia Sportage 2.4L may exceed the ORVR standard. 1761	Some 2014*2017 model year Kia Rio 1.6L vehicles have experienced a customer complaint in which certain customers smell fuel inside while they are driving in the city, especially in Stop-and-Go mode at high ambient temperature. According to the investigation, Kia has found that there is a necessity of EMS purge data optimization at the high temperature condition to improve customer satisfaction.			27701	3
1762	Some 2010*2015 model year Hyundai Tucson 2.4L may exceed the ORVR standard. According to an investigation of canister manufacturing process/subpart/production history, Analysis indicates that the displacement of the charcoal occurs nearly immediately. Because the Defect sponge inside the canister is too short in length, so charcoal dislodging occurs with the combination of charcoal tilting and the short sponge length. As a countermeasure, a supplemental canister will be applied between the faulty canister and the Canister Close Valve (CCV) for those canisters that fail an inspection. Hyundai will add the 150cc auxiliary canister for the vehicles that fail an inspection through a voluntary service campaign (VERR) with customer notification.			9735	1
1763	Some 2010*2015 model year Hyundai Tucson 2.4L may exceed the ORVR standard. 	Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire. If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs. These can include: Coolant loss with Check-Control-Indication Loss of power with 7 If applicable 7 Check-Control-Indication (depending on grade of damage) Smell of exhaust gas Unusual noise from the engine compartment Smoke development from the engine In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740Li xDrive 55d and 535d xDrive) produced between 07/01/2013 and 05/31/2017.	6/30/2013	6/29/2014	5167	5167
1787	On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL).	5/1/2017	4/30/2018	9612	0
1788	On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL).	5/1/2017	4/30/2018	9612	0
	The affected part number 13538627842 relates to the FUEL INJECTOR which is used beginning with 04/2017 solely as replacement part in service when original built injector with part number 13537645956 has to be replaced. Fuel injector with part number 13538627842 includes an improvement regarding tightness due to a DLC (Diamond-Like-Carbon) coated ball inside of the injector. The following analysis applies therefore to the original built fuel injector with part number 13537645956. Analysis have shown, that the component has been replaced in about 31% up to 42% (depending on Test Group) due to malfunctions of the component itself. The main reason for those malfunctions could be identified in defective filter material. In case this material shows breaks pollutant particles lead to temporary or steady leakages of the injection valve. These leakages could have an impact on drivability (e.g. bucking engine run) showing misfires, which are detected by OBD system storing a fault code with MIL illumination. More reasonable malfunctions are caused by sooting of the valve injection holes or damaged valves (e.g. breaks in valve seat or broken valve seats). In the other 58% up to 69% (depending on Test group) of all cases, the component injection valve has been replaced although it hasn't had a malfunction itself. Other components like ignition coil, high pressure sensor or ignition plugs have been in those cases the genuine reason for fault code storage and MIL illumination.

1864	Daimler AG has determined that the engine control unit software of the affected vehicles with 4- and 6-cylinder gasoline engine from the production range 12/2012 until 06/2017 may not meet internal specifications which could lead to an erroneous activation of the MIL. In certain circumstances when the vehicle is parked for longer than 6-8 hours, the temperature difference between t				5469	0
1865	Daimler AG has determined that on certain E- and G-Class as well as ML, GL and CLS vehicles (212, 463, 366, 216 platforms) with 8-cylinder gasoline engine M157 the software in the engine control module may not meet the internal specifications. In this case, OBD-relevant fault codes of the fuel temperature sensor and pressure sensor for the tank leak diagnosis that are stored in the fue				407	0
Daimler AG has determined that the soot particulate sensor could fail due to the following root causes: Root Cause A: Particles on the sensor element resulting from the manufacturing process. Root Cause B: Flaking of the electrode due to insufficient evaporation of humidity inside the sensor element. Both root causes lead to an electrical failure of the soot particulate sensor. In case of failure the Malfunction Indicator Lamp (MIL) is illuminated.					9818	1055

Solution: Previous analysis showed that there is a difference in take-off behavior between a break-through start and a normal start. Differences in the timing of the reset function during ignition-ON resulted in incorrect values of the initialization variables, which are issues in the initial function for crankcase-ventilation function				119248	119248
1876	Warranty Replacement Part Numbers / Version (Model Year/Model/Engine Code): 06K906070AB V9344 (MY13-14 Jetta, CPPA) 06K906070T V9345 (MY13-14 Jetta, CPLA) 06K906070AC V9346 (MY13-14 Beetle/Beetle Convertible, CPPA) 06K906070AA V9347 (MY13-14 Beetle/Beetle Convertible, CPLA) 06K906070F V9360 (MY14 Jetta, CPRA) 06K906070D V9361 (MY14 Jetta, CPKA) 06K906071E V9362 (MY14 Beetle/Beetle Convertible, CPRA) 06K906071D V9363 (MY14 Beetle/Beetle Convertible, CPKA) 06K906070J V9364 (MY14 Passat, CPRA) 06K906070H V9365 (MY14 Passat, CPKA) The conditions below are referenced from the following Field Fix documents: FF_DV2.085F_06_18 FF_DV2.03PA_10_18 FF_EV2.085F_13_18 FF_EV2.03PA_14_18 -Lambda Control, Dew Point End Conditioner Pre-Probe, and Quick Start after Catalyst Sensor: Event: NOx emissions above the FTP standard due to an inaccurately adapted second control loop ? a result of inhomogeneous exhaust gas distribution under certain engine load conditions affecting the lambda value expected by the ECM compared to the lambda value measured by the first lambda sensor. Solutions: (1) Correct the target lambda value for specific blocks within the fuel calibration map. (2) Enable quick start of the second lambda sensor, so the ECM can use its measured value as a secondary input sooner to modify the fuel mixture should it need to. -Suction Tube Model: Event: Under certain conditions, after the start up overshoot, a small rpm diver may occur which can be noticed by customers. Solution: Previous analysis showed that there is a difference in take-off behavior between a break-through start and a normal start. Differences in the timing of the reset function during ignition-ON resulted in incorrect values of the initialization variables, which are issues in the initial function for crankcase-ventilation function				119248	119248

	<p>Component: Fuel low pressure sensor (LPS).</p> <p>The LPS provides a value for closed loop control of the fuel pressure before the high pressure fuel rail.</p> <p>The circuit board inside the LPS is protected by a gel coating. The analysis of returned warranty parts indicate the gel has been found to be in various states of degradation. If the gel is degraded damage to the circuit board may occur, resulting in an activation of the Malfunction Indicator Lamp (MIL). If the sensor fails table values are used as replacement for the fuel pump target load.</p> <p>The concerned sensor went of production 2016 week 16.</p>			8211	8211

	High pressure fuel pumps (part numbers 9A111031506 and 9A1110315FX) are being replaced in the field due to the MIL being illuminated. Faults P1281, P053F and P1021 are most frequently stored. 1920 It has been determined that the material in the fuel filter was allowing dirt particles that were too large to enter the high pressure fuel pump. This would cause damage to the pump. The fuel filter material has been changed.			9799	78
	High pressure fuel pumps (part numbers 9A111031506 and 9A1110315FX) are being replaced in the field due to the MIL being illuminated. Faults P1281, P053F and P1021 are most frequently stored. 1921 It has been determined that the material in the fuel filter was allowing dirt particles that were too large to enter the high pressure fuel pump. This would cause damage to the pump. The fuel filter material has been changed.			5107	59
	High pressure fuel pumps (part numbers 9A111031506 and 9A1110315FX) are being replaced in the field due to the MIL being illuminated. Faults P1281, P053F and P1021 are most frequently stored. 1922 It has been determined that the material in the fuel filter was allowing dirt particles that were too large to enter the high pressure fuel pump. This would cause damage to the pump. The fuel filter material has been changed.			10574	96
	High pressure fuel pumps (part numbers 9A111031506 and 9A1110315FX) are being replaced in the field due to the MIL being illuminated. Faults P1281, P053F and P1021 are most frequently stored. 1923 It has been determined that the material in the fuel filter was allowing dirt particles that were too large to enter the high pressure fuel pump. This would cause damage to the pump. The fuel filter material has been changed.			10574	96
	Throttle body hoses (part numbers 95B145832A, 95B145832B and 95B145832C) are being replaced in the field for illuminating the MIL and partial loss of engine power. Fault P0299 is usually stored. The boot becomes dislodged from the throttle body, causing an air leak. 1924 Analysis found that it was improper assembly at the factory was the cause. The boot and assembly process were changed to make assembly easier and more secure.	3/5/2014	5/20/2015	12718	37
	? VVS Camshaft Adjustment Actuator Valves (Part#9A110530803) are being replaced in the field for illuminating the MIL, prompting immediate customer action. ? The Variable Valve Lift Control Monitor compares the difference between cylinder banks during small and large lift in closed loop operation, when the measured difference is larger or less than 18% then DTC P1381 or P1382 (P1381(Bank1) / P1382(Bank2); comparison of closed loop regulator differences between cylinder banks during small and large lift) is set. 1925 ? Analyses revealed a deformation inside of the VVS valve, caused by low temperature during the manufacturing process. This leads to an incomplete closing of the valve.	6/6/2013	5/27/2014	10574	47
	? VVS Camshaft Adjustment Actuator Valves (Part#9A110530803) are being replaced in the field for illuminating the MIL, prompting immediate customer action. ? The Variable Valve Lift Control Monitor compares the difference between cylinder banks during small and large lift in closed loop operation, when the measured difference is larger or less than 18% then DTC P1381 or P1382 (P1381(Bank1) / P1382(Bank2); comparison of closed loop regulator differences between cylinder banks during small and large lift) is set. 1926 ? Analyses revealed a deformation inside of the VVS valve, caused by low temperature during the manufacturing process. This leads to an incomplete closing of the valve.	6/6/2013	5/27/2014	10574	47
	The affected part number 11618507335 relates to the INTAKE MANIFOLD GASKET. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2015 Test Group FBMX703.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils). Please see corresponding EDIR-OF-N57/N47-0267. In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the 1927 component INTAKE MANIFOLD GASKET is/was working properly and has/had no malfunction.	7/31/2014	6/30/2015	7396	933

1920	<p>The part numbers 11157601453, 11158635843 and 11158647299 relate to the vent hose connecting line. Part number 11157601453 with index 03 has been used in production between 07/12 and 09/13. Between 10/2013 and 04/14 a modified component with same part number but different index (index 04) has substituted component with index 03 as production and as replacement part. This new part exhibits a notched ring, which should stabilize some due to temperature impact fragile areas of the vent hose connecting line. Between 05/14 and 06/15 an additional hardware improvement on the pipe connector has been introduced in production and as replacement part (part number 11158635843). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. This new component with part number 11158647299 is used since 07/15 in production and as a replacement part for previous model years.</p> <p>Analysis have shown that in about 90% the original assembled part with part number 11157601453 has been replaced because of leakage problems caused by fragile parts of the vent hose connecting line. These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. Since the usage of part number 11158635843, these problems could be reduced to 60% valid replacements.</p> <p>A complete elimination of the hardware issue could be fulfilled with introduction of the new material used with part number 11158647299.</p> <p>The component vent hose connecting line with part number 11158647299 therefore is robust, has/had no malfunction and is/was working properly.</p> <p>Considering the afore mentioned explanations the Weibull results and valid fail values listed in this report relate to the less-robust component vent hose connecting line with part numbers 11157601453 and 11158635843.</p>	6/30/2012	6/29/2013	39763	2400

This new component with part number 11158647299 is used since 07/15 in production and as a replacement part for previous model years.</p> <p>Analysis have shown that in about 90% the original assembled part with part number 11157601453 has been replaced because of leakage problems caused by fragile parts of the vent hose connecting line. These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. Since the usage of part number 11158635843, these problems could be reduced to 60% valid replacements.</p> <p>A complete elimination of the hardware issue could be fulfilled with introduction of the new material used with part number 11158647299.</p> <p>The component vent hose connecting line with part number 11158647299 therefore is robust, has/had no malfunction and is/was working properly.</p> <p>Considering the afore mentioned explanations the Weibull results and valid fail values listed in this report relate to the less-robust component vent hose connecting line with part numbers 11157601453 and 11158635843.</p>	2/28/2013	4/29/2014	15633	1200
1931	<p>The part numbers 11157601453, 11158635843 and 11158647299 relate to the vent hose connecting line. Part number 11157601453 with index 03 has been used in production between 07/12 and 09/13. Between 10/2013 and 04/14 a modified component with same part number but different index (index 04) has substituted component with index 03 as production and as replacement part. This new part exhibits a notched ring, which should stabilize some due to temperature impact fragile areas of the vent hose connecting line. Between 05/14 and 06/15 an additional hardware improvement on the pipe connector has been introduced in production and as replacement part (part number 11158635843). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. This new component with part number 11158647299 is used since 07/15 in production and as a replacement part for previous model years.</p> <p>Analysis have shown that in about 90% the original assembled part with part number 11157601453 has been replaced because of leakage problems caused by fragile parts of the vent hose connecting line. These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. 1941	Customer may experience a chirping noise coming from the high-pressure fuel pump. Sound may be most noticeable during hot idle.			22035	22035
	<p>The affected part number 13538506547 relates to the HIGH PRESSURE PIPE (ACCUMULATOR-TO-INJECTOR).</p> <p>Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2015 Test Group FBWXT03.0N57, BMW decided a warranty extension to full useful life (10 years / 120,000mi). Please see corresponding EDIR-OF-N57/N47-0267.</p> <p>In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50,000mi). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component HIGH PRESSURE PIPE (ACCUMULATOR-TO-INJECTOR) is/was working properly and has/had no malfunction.</p>	7/31/2014	6/30/2015	7396	933
	<p>The affected part number 13628582023 relates to the component PM sensor. Component with part number 13628582023 is an improved / more robust PM sensor which has been used in production and as spare part in service (whenever component with part number 13628517184 built in production by 10/2015 or component with part number 13628582023 built afterwards has to be replaced) since 10/2015.</p> <p>Analysis has shown that in 98% of all cases the component PM sensor has been replaced correctly due to OBD system triggered fault code and MIL illumination. Main reason for a malfunction of the sensor has been a harmed protection layer of the sensor. This malfunction applies in general to component with part number 13628517184 as built in production by 10/2015. Component with part number 13628582023 assembled since 10/2015 itself is robust, have/had in general no malfunctions and are/were working properly.</p> <p>1943 The analyses for component PM sensor therefore applies to part number 13628517184 instead of part number 13628582023.</p>	3/31/2015	3/30/2016	1693	850
	<p>Due to BMW internal testing (data analysis), BMW has detected an issue with component crankshaft sensor as built in different models with 3-cylinder engines B36/B38, 4-cylinder engines B46/B48 and 6-cylinder engine B58 produced between 05/16/2018 and 06/13/2018.</p> <p>Defect description:</p> <p>1944 A software bug in the chip of the crankshaft sensor could freeze the adaptation value between the crankshaft reluctor wheel and the sensor. The signal values of the reluctor wheel would be lost, which will lead to an OBD related failure storage, reduced power and MIL illumination.</p>	5/15/2018	6/6/2018	1175	1175
	<p>Due to BMW internal testing (data analysis), BMW has detected an issue with component crankshaft sensor as built in different models with 3-cylinder engines B36/B38, 4-cylinder engines B46/B48 and 6-cylinder engine B58 produced between 05/16/2018 and 06/13/2018.</p> <p>Defect description:</p> <p>1945 A software bug in the chip of the crankshaft sensor could freeze the adaptation value between the crankshaft reluctor wheel and the sensor. The signal values of the reluctor wheel would be lost, which will lead to an OBD related failure storage, reduced power and MIL illumination.</p>	5/16/2018	6/6/2018	810	810
	<p>A customer may report the malfunction indicator lamp (MIL) is illuminated, lack of power and sometimes noise coming from the engine bay. The stored diagnostic trouble code (DTC) points to "turbocharger under-boost" which results from a failure of the Turbo-Exhaust Manifold.</p> <p>1946 Jaguar Land Rover introduced a brazed scroll manifold which at high time in service is starting to disintegrate. The root cause being a combination of thermal fatigue and vibrations which will make the joints loose.</p>			6887	2961
	<p>Customer Complaint: MIL on, vibration, and engine compartment noise</p> <p>Component: Catalytic Converter Support Bracket</p> <p>Production Part Number (Catalyst): 7P0 254 301 CX</p> <p>Part analysis reflects part number: 7P0 254 301 CX</p> <p>Due to improper positioning of a welding tool, the weld load-bearing cross-section could be too thin; which could lead to a crack in the Catalytic Converter support bracket to crack. This condition is specific to the catalyst support bracket on the passenger side of vehicle only, cylinders 4-6. Prior to this improvement, catalytic converter replacements were consequentially replaced due to the bracket concern described above.</p>			4894	4894
1948	<p>The part numbers 11157640285, 11158637873 and 11158647961 relate to the vent pipe PCV. Part number 11157640285 with index 01 has been used in production between 07/12 and 01/14. Between 02/2014 and 04/14 a modified component with same part number but different index (index 03) has substituted component with index 01 as production and as replacement part. This new part exhibits a notched ring, which should stabilize some due to temperature impact fragile areas of the vent pipe. Between 05/14 and 06/15 an additional hardware improvement in the welding geometry of the vent pipe has been introduced in production and as replacement part (part number 11158637873). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. This new component with part number 11158647961 is used since 07/15 in production and as current replacement part for vehicles produced before.</p> <p>Analysis has shown that in about 90% the original assembled part with part number 11157640285 has been replaced because of leakage problems caused by fragile parts of the vent pipe. These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. Since the usage of part number 11158637873 in 05/14, these problems could be reduced to 60% valid replacements.</p> <p>A complete elimination of the hardware issue could be fulfilled with introduction of the new material used with part number 11158647961 beginning with 07/15.</p> <p>The component vent pipe PCV with part number 11158647961 therefore is robust, has/had no malfunction and is/was working properly.</p> <p>Considering the afore mentioned explanations the Weibull results and valid fail values listed in this report relate to the less-robust component vent pipe PCV with part numbers 11157640285 and 11158637873.</p>	6/30/2012	5/31/2013	39763	2400

	Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in regions with high ambient temperatures (+100 deg. F). The vehicles are able to be restarted.				
1963	Nissan has investigated and found that this issue is caused by the ECM miscalculating the amount of purge gas inside the evap canister in extreme hot weather conditions. When this occurs, excess gas enters the engine causing the engine to run rich and hesitate/stop.			5383	41

	Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in regions with high ambient temperatures (+100 deg. F). The vehicles are able to be restarted.				
1965	Nissan has investigated and found that this issue is caused by the ECM miscalculating the amount of purge gas inside the evap canister in extreme hot weather conditions. When this occurs, excess gas enters the engine causing the engine to run rich and hesitate/stop.			7009	0
	Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in regions with high ambient temperatures (+100 deg. F). The vehicles are able to be restarted.				
1966	Nissan has investigated and found that this issue is caused by the ECM miscalculating the amount of purge gas inside the evap canister in extreme hot weather conditions. When this occurs, excess gas enters the engine causing the engine to run rich and hesitate/stop.			1334	0
	Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in regions with high ambient temperatures (+100 deg. F). The vehicles are able to be restarted.				
1967	Nissan has investigated and found that this issue is caused by the ECM miscalculating the amount of purge gas inside the evap canister in extreme hot weather conditions. When this occurs, excess gas enters the engine causing the engine to run rich and hesitate/stop.			1869	0
1968	Spark plugs (Part Number 99917023390) are being replaced in the field for illuminating the MIL. Misfire codes are usually stored, which prompts immediate customer action.			14252	26
1969	High Pressure Fuel Pumps (part number 94611031561) are being replaced in the field for illuminating the MIL or a ticking noise, prompting immediate customer action. Most frequent DTCs set are P1021, P1023 and P1026.			14252	67
1970	High Pressure Fuel Pumps (part number 94611031561) are being replaced in the field for illuminating the MIL or a ticking noise, prompting immediate customer action. Most frequent DTCs set are P1021, P1023 and P1026.	3/13/2014	5/22/2015	12718	62
1971	High Pressure Fuel Pumps (part number 94611031561) are being replaced in the field for illuminating the MIL or a ticking noise, prompting immediate customer action. Most frequent DTCs set are P1021, P1023 and P1026.			14252	67
1972	Oil line restrictors are being replaced in the field for MIL illumination. Fault codes most frequently stored are P1372 for valve lift and P000A, P000C camshaft slow response for bank 1 and bank 2, respectively.	6/10/2013	5/28/2014	4166	80
	Post catalyst oxygen sensors (part numbers 9A790626550 and 9A790626551) are being replaced in the field for MIL illumination. Fault codes most frequently stored are P227000 and/or P227200- "Oxygen Sensor bank 1 and/or 2 Signal Stuck Lean" Analysis shows that the reference air canal of the sensor was contaminated with Silicone (SiO2) that originated from the cable protection sheath. The sheath was changed to an alternative material.				
1973	Analysis also showed that the temperature of the sensor was too low during diagnosis, so the heating model of the engine ECU software was changed.			3107	261

	<p>The affected part number 11787614322 relates to the Heated Rear Oxygen Sensor. Analyses have shown, that the component rear oxygen sensor was replaced in 100% of all cases due to different valid malfunctions:</p> <p>a) Contamination of the oxygen sensor (Baron is dispered from the boron nitride disk)</p> <p>b) Break of the ceramic caused by vibrations due to material degradation in the heater element causes by phase shifting from tetragonal to a monocline phase in the area of the through-connection holes of the ceramics</p> <p>c) Signal adulteration caused by humidity entrance via plug of the oxygen sensor</p> <p>All of this malfunctions lead to an OBD fault code storage (e.g. P0141 and P0161) including MIL illumination.</p>				
1990		2/28/2013	5/31/2014	15275	1833
	<p>The affected part number 13538508084 relates to the FUEL FEED LINE (TO HIGH PRESSURE PUMP).</p> <p>Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2015 Test Group FBMX703.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils). Please see corresponding EDIR-OF-N57/U47-0267.</p> <p>In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FUEL FEED LINE (TO HIGH PRESSURE PUMP) is/was working properly and has/had no malfunction.</p> <p>1992 Customer vehicle may exhibit decreased front windshield defroster performance at extremely low ambient temperatures. This condition may be the result of the fresh/recirculation servo actuator separating from the servo, causing the HVAC system to become stuck in recirculation.</p> <p>1993 Vehicles equipped with a 3UR-FBE flex fuel engine may experience a MIL 70N77 condition with DTCs: P0171 (System Too Lean Bank 1), P0172 (System Too Rich Bank 1), P0174 (System Too Lean Bank 2), P0175 (System Too Rich Bank 2), P1604 (Start Failure Determination) and/or extended cranking. This condition is caused by fuel pressure below specification.</p> <p>1994 Vehicles equipped with a 3UR-FBE flex fuel engine may experience a MIL 70N77 condition with DTCs: P0171 (System Too Lean Bank 1), P0172 (System Too Rich Bank 1), P0174 (System Too Lean Bank 2), P0175 (System Too Rich Bank 2), P1604 (Start Failure Determination) and/or extended cranking. 	<p>The subject vehicles are equipped with a 3.5L V6 2GR-FSE gasoline engine with an intake port injection system containing two fuel pulsation dampers. The diaphragm material in the fuel pulsation dampers may harden over time due to a chemical process involving amine in the fuel, higher ethanol content in fuels used in countries such as the U.S., Canada, and China, and high temperatures. If this were to occur, cracks could develop on the diaphragm, causing fuel to leak. A fuel leak in the presence of an ignition source can increase the risk of a vehicle fire.</p>			23953	23953

	Due to a logistic failure, the wrong fuel delivery module (located inside the fuel tank) could be installed by the supplier (e.g. delivery module with an outlet for auxiliary heating system, but no auxiliary heating system as an additional hardware installed). As a result the correct supply pressure could not be reached. If the pressure is too high a noise issue or fuel entry in the crankcase could be possible. If the supply pressure is too low an engine stalling could be possible. In these cases, where the delivery module has an outlet for an auxiliary heating system but no auxiliary heating system as an additional hardware is installed, the outlet is covered with a dust cover. Since this area of the system (adapter) has atmospheric pressure, it is expected the component duct cover could be lost only in few cases after a higher mileage. Only in these cases a leakage would be possible which could result in a fuel emission (dropwise). It is expected, that in about 684 vehicles (models 5 Series, 6 Series and 7 Series with different engines (e.g. 4-cylinder engine B46, 6-cylinder engine B58 and 8-cylinder engine N63) the wrong fuel delivery module could be installed in production period 07/2015 through 03/2018.	6/30/2017	2/28/2018	109	109

2034	Some 2018 model year Kia Stinger equipped with 2.0L T-GDI engines have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P053F (Fuel Pressure Control System). According to Kia's investigation, the cause for this MIL is low operating electric current at the high pressure pump fuel control valve. Kia has changed software to improve the electric current at the high pressure pump fuel control valve.			5236	76
2035	Some 2014MY Jeep Grand Cherokee vehicles with a 3.6L engine (sales code E88) may experience issues getting the downstream oxygen sensor (O2) monitor to complete after the vehicles have had the US6 recall performed. During this condition, the vehicle will fail to clear fuel system readiness.			226357	1200
2036	Due to inappropriate calibration of the PCM and TCM, engine oil may be diluted with fuel when short trip driving operation is repeated during winter season in cold weather (low engine oil temperature condition). After that, when fully warmed up the diluted fuel in the engine oil may evaporate rapidly and the MIL may illuminate.	8/2/2017		23920	6
2037	Due to inappropriate calibration of the PCM and TCM, engine oil may be diluted with fuel when short trip driving operation is repeated during winter season in cold weather (low engine oil temperature condition). After that, when fully warmed up the diluted fuel in the engine oil may evaporate rapidly and the MIL may illuminate.	8/2/2017		23920	6
2038	Due to inappropriate calibration of the PCM and TCM, engine oil may be diluted with fuel when short trip driving operation is repeated during winter season in cold weather (low engine oil temperature condition). After that, when fully warmed up the diluted fuel in the engine oil may evaporate rapidly and the MIL may illuminate.	4/25/2017	10/3/2017	13219	8
2039	Due to inappropriate calibration of the PCM and TCM, engine oil may be diluted with fuel when short trip driving operation is repeated during winter season in cold weather (low engine oil temperature condition). After that, when fully warmed up the diluted fuel in the engine oil may evaporate rapidly and the MIL may illuminate.	4/25/2017	10/3/2017	13219	8
2040	Some 2018 MY Jeep Wrangler and 2019 MY Jeep Cherokee vehicles equipped with a GME-T4 engine (sales code: EC1 and EC3) may have an EGR hose that is prone to tear. This can cause a MIL to illuminate with a mix of potential DTCs associated with manifold vacuum leaks, including P2172 which will cause the vehicle to enter 7Limp Mode?? Root cause was determined to be a support			16895	16895
2041	Some 2018 MY Jeep Wrangler and 2019 MY Jeep Cherokee vehicles equipped with a GME-T4 engine (sales code: EC1 and EC3) may have an EGR hose that is prone to tear. 2077	<p>Recent fleet testing of a 3.3L T-GDI engine indicated that performance of N2O control may behave differently than expected. It has not been confirmed that this is a general issue related to the overall performance of the 3.3 T-GDI engine, or an individual performance of the single engine. However, current analysis has raised a possibility that unexpected heat loss due to the turbocharger performance may alter the expected chemical composition and transformation of N2O gas development and control. Additional investigation is underway.</p> <p>Hyundai has not determined that a defect exists at this time, and is not aware if, or of, a specific number of customer vehicles or engines that have experienced this issue in the field. Hyundai's experience to date is limited to one fleet vehicle and its internal review of the N2O chemistry and performance. However, in an abundance of caution, Hyundai is issuing this EDIR as it is considered possible that such performance may occur in the field under some typical driving conditions.</p>			1082	0
2078	<p>After the 7sport response?? drive program is terminated, the exhaust flaps stay open for the whole driving cycle and the Cylinder Deactivation function is Disabled. The exhaust flaps stay opened and the cylinder deactivation is also disabled in the next driving cycle</p> <p>If the driver changes the drive program or selects the Sport Exhaust, the position of the exhaust flaps close and cylinder deactivation is enabled again.</p> <p>The topic is relevant for the Panamera, Panamera S and Panamera Turbo. There is only an influence of the fuel consumption at the Panamera Turbo.</p>	9/24/2016	6/13/2017	3438	0
2079	<p>Some 2018 model year KIA Stingers equipped with 2.0L T-GDI engines have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P053F (Fuel Pressure Control System). According to the investigation, the main cause is low operating electric current at high pressure pump fuel control valve.</p> <p>Kia has improved the electric current for the driving in ECU to fix this...</p>			5298	76
2080	<p>Some 2018 model year KIA Stingers equipped with 2.0L T-GDI engines have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P053F (Fuel Pressure Control System). According to Kia's investigation, the cause for this MIL is low operating electric current at the high pressure pump fuel control valve. Kia has changed software to improve the electric current.</p>			5298	76
2081	<p>Some 2018 model year KIA Stingers equipped with 2.0L T-GDI engines have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P053F (Fuel Pressure Control System). 2083	<p>The affected part number 13907614013 relates to the FUEL TANK BREATHER VALVE. Analyses have shown, that in 100% of all cases one of the following two different hardware failures could cause the malfunctioning tank breather valve, which are both detected by the OBD system (fault code entry including MIL illumination). Failure #1 (Knobs failure mode): The rubber structure of the knobs pressed in the hole of the valve bumper could crack in the area between chamfer and hole and in the following could detach and get lost in the backside. Due to the missing rubber structure there is a metal to metal contact in the fuel tank breather valve, which could result in a blocked valve and could lead to a too lean fuel mixture, which is detected by the OBD.</p> <p>Failure #2 (Retractable membrane): Due to failures in the production process the retractable membrane (plastic material) of the non-return valve could brake completely. This malfunction could be caused either by an extruding failure or by a pre-damage of the membrane due to a ridge on the seat engaging surface of the anker. For vehicles with one fuel tank breather valve this malfunction (broken membrane) will be detected by the OBD as small leakage, for vehicles with two valve as a leakage of the second purge line.</p>	6/30/2015	6/29/2016	16499	4950
2084	<p>The affected part number 13518604232 relates to the component HIGH PRESSURE FUEL PUMP. Analysis has shown that in about 81% of all cases the high pressure pump has been replaced due to a correct fault code entry and MIL illumination, identifying the malfunction of that specific component. Deterioration of gasoline filter materials emitting small filter particles, lead to a blockade of the high pressure valve. The deterioration of the gasoline filter could be traced back to high temperature conditions and low gasoline quality respectively inadequate gasoline additives.</p> <p>Beginning with 12/2015 a new filter material (PPEEK?? instead of PA) for the filter was introduced in production and services.</p>	2/28/2014	5/31/2015	11445	1259

2103	<p>The affected part numbers 51137497285, 51747497279, 51748091762 and 51138091760 relate to the Lower and Upper Air Flaps (Active Grill Shutters). Analyses have shown that these components were replaced in about 95% of all cases due to a malfunction detected by the OBD system including fault code storage and MIL illumination (e.g. electrical failure of actuator, stuck shutter, shutter performance). There are two different failures which could cause these valid malfunctions:</p> <p>Failure#1 (about 85% of all valid failures): Contamination (mix of transmission oil, brush dust and copper abrasion) of the commutator (daubed commutator slit) leads to an increased current of the actuator so that this component fails. Failure#2 (about 15% of all valid failures): The kinematics /component ?space? (connecting element of the coupling bar between actuator and the shutters) could be unhinged or lost, so that the shutters could not be controlled/moved any more.</p>	6/30/2016	5/31/2017	5037	1914
2104	<p>Customer Complaint: MIL on Component: Intake Manifold Production Part Number: 06J 133 185 DT (MY13), 06J 133 185 EQ (MY14) Warranty Replacement Part Number: 06J 133 201 BH The following DTC was observed: -P2015 (Intake Manifold Runner Position Sensor Range/Performance) Part analyses reflect part numbers: 06J 133 185 DT and 06J 133 185 EQ 16x Part Cracked 7x Binding Gear 6x Contaminated by carbon 3x Noisy 2x Bad (implausible Poti signal) 1x Stuck Open 1x Stuck Closed 1x Plate Sticks 39x No trouble found Failure Analysis: Intake manifold runner can separate internally and will not operate correctly with the regulator valve. A malfunctioning intake manifold runner may cause a MIL on condition.</p>			5082	186
2105	<p>-Complaint: MIL and/or Runs Rough -Cause: ECM Software 1)Diagnostic signal for Knock Sensor 2 is too low/high and unauthorized error messages are generated. 2)With dynamic load changes misfires can occur (without DTCs). 3)Oil level warning lamp is illuminated (too high). 4)Misfire in COD operation (Cylinder On Demand). 5)The stopping time of the coolant pump may be, under certain conditions, too short to prevent cooling system damage. -Correction: updated ECM software 1)The knock sensor diagnostic has been optimized (data adjustment). 2)The combustion is adapted and optimized in the engine control. 3)The threshold for oil level warning is too small. Consequently the threshold for the oil level warning has been increased and adapted. The request for warming up occurs earlier. 4)The running time while in COD mode is reduced. To prevent misfires when switching to full engine operation, the parameters have been adjusted. 5)The stopping time of the coolant pump was adjusted to prevent damage to the cooling system.</p> <p>Model Year/Model/Production Software/Replacement Software 2013 56, 574G0906014B V00074G0906014B V0009 2013S84H0907557E V00034H0907557E V0004 2014S84H0907557E V00034H0907557E V0004 2014S6, 574G0906014E V00044G0906014E V0006 2014R574G0906560B V00064G0906560B V0008</p>			4364 755	4364 59
2106	High Voltage batteries (part numbers 7PP915590 X, 7PP915590AX, 7PP915590B, 7PP915590C, 7PP915590H, 7PP915590HX, 7PP915590KX) are being replaced in the field due to illumination of the MIL. The fault code most frequently stored is P0A8000, which indicates high internal resistance in the battery. Batteries that have be	9/30/2013	5/22/2014		
2107	<p>The affected part numbers 51137497285, 51747497279, 51748091762 and 51138091760 relate to the Lower and Upper Air Flaps (Active Grill Shutters). 2119	<p>Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire. If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs.</p> <p>These can include: ?Coolant loss with Check-Control-Indication ?Loss of power with ? if applicable ? Check-Control-Indication (depending on grade of damage) ?Smell of exhaust gas ?Unusual noise from the engine compartment ?Smoke development from the engine</p> <p>In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740Li xDrive 535d and 535d xDrive) produced between 07/01/2013 and 05/31/2017</p>	2/28/2014	6/29/2015	1505	1505

	Q	R	S	T	U
2137	<p>Daimler AG has determined that on certain GLE-Class (platform 166), SL-Class (platform 172), C-Class (platform 204), E-Class (platforms 207, 212), S-Class (platforms 216, 217, 221, 222), CLS-Class (platform 218), SL-Class (platform 231), R-Class (platform 251), GLC-Class (platform 253), G-Class (platform 463) vehicles with 4-, 6- and 8-cylinder gasoline engines catalyst heating might not be active in one special use case. The issue only occurs when the following unusual circumstances occur in combination: The engine is turned off after a driving cycle where it was fully warmed up. At the next engine-start / driving cycle the engine is started and turned off after no more than 2 seconds of operation. At the subsequent engine start / driving cycle catalyst-heating is not activated. In this case, due to a delayed heating up of the catalyst, an impact on emissions cannot be ruled out.</p>			10322	0
2138	<p>The affected part number 13538616079 relates to component injection valve (fuel injector) by supplier Continental, which is only used for model X6 xDrive50i (for model X5 xDrive50i an injector by supplier Bosch is built; please see also EDIR-06-NG3TUE-0251). This part number 13538616079 is used in production beginning with 02/2013. Analyses have shown, that in about 50% of all cases the component injection valve was replaced due to misfire events including fault code storage and MIL illumination. In general these misfire events were be caused by an electrical malfunction (faulty operation of the injector) due to contamination (welding bead) at the contact/connection caused by the supplier during the production process. In addition leakages due to gelation of the compensator (in general after a dead time of 2 up to 3 years due to oxygen entered in the compensator oil of the fuel injector) or a defective filter material (filter material shows breaks pollutant particles leading to temporary or steady leakages of the injection valve) could also lead to the misfire events. In the other 50% of all cases, the component injection valve has been replaced although it hasn't had a malfunction itself. In these cases other components like ignition coil, high pressure sensor or ignition plugs have been in those cases the genuine reason for the fault code storage (e.g. for misfire) and MIL illumination.</p>	3/31/2013	12/30/2014	4615	2215
2139	<p>Daimler AG has determined that certain MY12-18 vehicles of diverse platforms could experience a software error. If a shortcut occurred within the injector while the engine was switched off, the failure code for this short cut would not be stored and the MIL would not be activated. However, in case of a confirmed shortcut, the MIL would be activated by a subsequent failure mechanism (misfire detection) and the workshop would replace the correct part. Based on a field claim analysis of potentially affected vehicles worldwide, the probability of occurrence of the described failure is lower than 0.00018 %.</p>			12931	0
2140	<p>Daimler AG has determined that certain MY12-18 vehicles of diverse platforms could experience a software error. 2154					
	The affected part number 13537823400 relates to the FRONT FUEL RETURN LINE [RETURN PIPE]. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2017 Test Group HBMXT03.0N57, a final decision based on the final analysis results is expected in 01/2019 (e.g. if a warranty extension to full useful life (10 years / 120.000mils; equivalent to EDIR-0E-N57-0177) or any other measurement (as e.g. a service campaign with replacement of component high pressure fuel pump at next service visit) will be decided). In case the high pressure fuel pump is pre-damaged or already malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FRONT FUEL RETURN LINE [RETURN PIPE] is/was working properly and has/had no malfunction.	7/31/2016	7/31/2017	2614	544

	<p>The part number 13518573162 relates to the gasoline lubricated component high pressure pump (Diesel) as built in production for MY16 Diesel models with 6 cylinder engine N57 (Test Groups GBMXV03.0N57 and GBMXT03.0N57). Beginning with 12/2016 a more robust hardware with part number 13518597821 was introduced in production and as replacement part in service. The part number 13518571796 relates to the gasoline lubricated component high pressure pump (Diesel) as built in production for MY16 Diesel models with 4 cylinder engine N47 (Test Groups GBMXV02.0N47 and GBMXT02.0N47). Beginning with 12/2016 a more robust hardware with part number 13518597819 was introduced in production and as replacement part in service. Analysis (applying to the original built part numbers 13518573162 and 13518571796 for component high pressure fuel pump Diesel) have shown that regional varying gasoline quality have a great impact on the mechanical deterioration of the component high pressure pump. In worst cases a lower quality could lead to a break down respectively to mechanical cuttings of the high pressure pump track roller. Those metal warfs could float through the entire fuel system (e.g. high pressure/low pressure system and tank) and accumulate anywhere. Such a contaminated system could not provide the necessary rail pressure at engine start (causing a non-starter) respectively could lead to a limp home mode including a performance reduction. OBD system will identify those malfunctions and trigger a fault code storage with MIL illumination. The replacement of the high pressure fuel pump has been in all cases the right measure to repair the malfunction.</p>	11/30/2015	7/30/2016	1696	152

The replacement of the high pressure fuel pump has been in all cases the right measure to repair the malfunction.</p> <p>2161 The lower lid within the fuel filler neck of the cap less unit does not close properly.</p> <p>2162 The lower lid within the fuel filler neck of the cap less unit does not close properly.</p>	6/30/2015	10/30/2016	1209 41 41	212 41 41
	<p>019MY G90 and G80 vehicles equipped with 5.0L GDI engine may experience an issue that the collected readiness data of the fuel system is not indicated as being "completed" even though the fuel system monitoring is actually been completed. According to the investigation, the main cause is an inappropriate ECU data calibration when it comes to indicating the completion.</p>			183	1
	<p>Some 2017, 2018MY G90 vehicles with 5.0L GDI engine may experience the intermittent faulty start under the certain RPM conditions. According to the investigation, This unusual poor start happens to vehicles when the noise signal appears during the initial ignition on/start. Hyundai will apply noise reduction logic to the Crank Shaft Position Sensor to improve this problem.</p>			1772	4
	<p>Based on manufacturer technical/data analysis, BMW detected a software failure implemented on all BMW/MINI vehicles with Bosch Engine Control Module MEVD17.2.3 produced between 03/01/2018 by 07/31/2018. Failure description: The locking of the ECM is implemented to avoid the manual deleting of permanent diagnostic trouble codes (DTC). If the locking is not active, (permanent) DTCs could be deleted manually with a diagnostic tool. In the affected ECMs/vehicles the locking of ECM is not active.</p>	6/30/2017	10/30/2018	21020	21020

2169	<p>The affected part number 16117260648 relates to the FUEL PUMP [DELIVERY MODULE]. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMXV03.0N57, BMW decided a warranty extension to full useful life (10 years / 120,000mils). Please see corresponding EDIR-DC-N57/N47-0311. In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50,000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FUEL PUMP [DELIVERY MODULE] is/was working properly and has/had no malfunction.</p>	6/30/2015	9/30/2016	1209	359
2170	The evaporative canister filter may become blocked by the combination of accumulated dirt and snow if driven in an extremely dirty environment. The MIL may illuminate for P2422 "Evaporative Emission (EVAP) System Vent Shut Valve Close Malfunction".	2/2/2015	11/7/2016	186059	65

2190	On some 2019 Infiniti QX50 vehicles, customers have experienced a fuel odor inside the vehicle's cabin. Infiniti has investigated and found that the end point of the Evap canister filter vent hose is connected to a portion of the frame member which also shares a small connection to the cabin through a body panel flange. Under certain conditions (hot ambient air temperature / HVAC system)				33065	53
	Wrong screwing/connection of the high pressure pump (HDP) on selected model year 2018 and 2019 vehicles with 8-cylinder engines N63 produced between 10/10/2018 and 05/08/2019 (based on evaluation of the screwing curve) could lead to the following scenario: During engine operation this wrong screwing/connection of the HDP could get untightened, the HDP experiences an overload so that the adapter of the HDP could break. As a result the connected fuel line could get untightened so that fuel could leak from the fuel line. The drop down of the fuel rail pressure will be detected by OBD including fault code storage and MIL illumination. In case of further drop down a limp home mode will be activated including information for the driver.	2/28/2019	5/7/2019		7	7
2191						
	Sodium in the fuel may contaminate the surface of the fuel pump motor brushes that may cause fuel flow to decrease. As a result, the MIL may illuminate for P0087 "Fuel System Pressure (Low)" or in some cases vehicle may stall.	6/2/2014	8/31/2015		32141	47
2192						
	Sodium in the fuel may contaminate the surface of the fuel pump motor brushes that may cause fuel flow to decrease. As a result, the MIL may illuminate for P0087 "Fuel System Pressure (Low)" or in some cases vehicle may stall.	11/4/2016	12/4/2017		69453	99
2193	During a State Inspection or using a dealer routine service tool, the VIN may not be displayed on the service tool. The retailer/center may be unable to cross check the VIN from the chassis to that contained in the PCM.				639	639
2194	During a State Inspection or using a dealer routine service tool, the VIN may not be displayed on the service tool. The retailer/center may be unable to cross check the VIN from the chassis to that contained in the PCM.				571	571
2195	During a State Inspection or using a dealer routine service tool, the VIN may not be displayed on the service tool. The retailer/center may be unable to cross check the VIN from the chassis to that contained in the PCM.				1471	1471
2197	On some MY2017 Nissan TITAN vehicles, customers are experiencing MIL illumination (DTC P0448) for the EVAP valve in a stuck-closed position. Nissan has investigated and found that, under certain conditions, the EPT foam seal around the fuel filler neck may not be fully secured and can potentially allow water to enter the EVAP line, filling the canister and causing the MIL illumination.	8/2/2017			51012	27
2198	Due to inappropriate calibration of the PCM and TCM, engine oil may be diluted with fuel when short trip driving operation is repeated during winter season in cold weather (low engine oil temperature condition). After that, when fully warmed up the diluted fuel in the engine oil may evaporate rapidly and the MIL may illuminate				31406	8
	Complaint:MIL on DTCs Present:P0456 EVAP Emission Control System - very small leak detected (30.3%) P0456 EVAP System Very Small Leak Detected - Fresh Air Side (23.6%) Other EVAP system-related fault codes (12.7%) No fault codes present (9.4%) Other unrelated fault codes (24.0%) Component:EVAP Purge Valve & Hose Assembly Part Number ? Production:04E 906 517 Part Number ? Replacement:04E 133 366 AH Part Number ? Analysis:04E 906 517 Analysis:A)Possible influence from lubricating fluid while inserting purge-valve into valve/hose sub-assembly. 8x internal leaking (12.1%) 1x incorrect purge flow (1.5%) 8)Due to improper diagnosis, technicians are performing unnecessary parts replacements in service (VW has issued a knowledge article to better assist technicians with diagnosis).				1896	20
2199	57x no trouble found (86.4%)				93211	3381
2200	Some 2014 MY Jeep Cherokee (KL) vehicles equipped with a 3.2L engine (Sales code: EHB) may experience a loss of motive power while driving due to a commanded shift to neutral, most likely at highway speeds. This event most frequently occurs during the 7th-8th gear shift due to a sticking clutch valve that will prevent the dog clutch from releasing. If the vehicle should experience this condition					
	The affected part number 13538506546 relates to the FUEL RAIL-INJECTOR FUEL LINE. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2018 Test Group JBMXT03.0N57, BMW decided a warranty extension to full useful life (10 years / 120,000mils) (please see EDIR-GJ-N57-0325). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50,000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FUEL RAIL-INJECTOR FUEL LINE is/was working properly	8/31/2017	7/30/2018		3366	552
2201	and has/had no malfunction.

	<p>Hyundai Motors America, Inc. is conducting an important Product Improvement Campaign to update software on 2011~2018 MY Sonata, 2013~2018 MY Santa Fe Sport, 2014~2015 MY and 2018 MY Tucson vehicles equipped with 2.0L and 2.4L GDI engines to protect the engine from connecting rod bearing damage.. The update will only involve the addition of newly developed computer software for the Engine Control Unit (ECU). Hyundai recently developed a Knock Sensor Detection System (KSOS)that detects vibrations indicating the onset of connecting rod bearing wear in the engine. The KSOS is designed to alert a vehicle driver at an early stage of bearing wear before the occurrence of engine damage including engine failure.</p>			71360	0

In the presence of an ignition source, leaking fuel may result in a fire.</p> <p>On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL).</p>	5/1/2018	4/30/2019	22379 129	22379 0
	<p>2019 model year KIA Rio equipped with 1.6L engine have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P0128. According to the investigation, the main cause is an improper data calibration for modeling temperature of the engine coolant data in ECU that has a difference of the temperature between modeling data of the engine coolant and the actual engine coolant data. To correct this problem, Kia will reprogram the ECU data.</p> <p>The Evaporative Emissions Leak Monitor diagnostic completion ratio can be overstated due to a miscalculation of the denominator value. The completion ratio identifies when the indicated diagnostic 'should' have completed versus when it did. The evaluation did not increment the denominator beyond a value of 1.</p> <p>The Evaporative Emissions Leak Monitor diagnostic completion ratio can be overstated due to a miscalculation of the denominator value. The completion ratio identifies when the indicated diagnostic 'should' have completed versus when it did. The evaluation did not increment the denominator beyond a value of 1.</p> <p>Due to a possible use of an unsuitable tool for fixing the clamp on the hose in the US vehicle reassembly plant, the affected vehicles could show a minor fuel leakage at the lower connecting point of the transition hose, between the underbody fuel line and the Schrader valve. In this case, fuel leakage in the presence of a potential ignition source within the engine compartment could create a fire hazard.</p> <p>Due to a possible use of an unsuitable tool for fixing the clamp on the hose in the US vehicle reassembly plant, the affected vehicles could show a minor fuel leakage at the lower connecting point of the transition hose, between the underbody fuel line and the Schrader valve. 	<p>On certain six-cylinder diesel E350 BlueTec vehicles, the intake port shutoff actuator motor could have failed due to electrical short circuit faults. These are caused by oil contamination coming from a leaky clean air line connector to the turbo charger, positioned directly above the actuator motor.</p> <p>In the clean air line, blow-by-gas is mixed with clean air. Usually blow-by-gas contains traces of oil due to crank case ventilation. In case of a leakage at the clean air line connector, oil could weep after engine stand still. As long the engine is running, there is underpressure in the clean air line, so it is ensured blow-by-gas can't get out at the connector.</p> <p>The oil contamination could crawl inside the actuator housing and could lead to electrical short circuit faults. These short circuit faults would lead to a failing of the actuator motor and an illumination of the Malfunction Indicator Lamp (MIL).</p> <p>The root cause of the leakage is incorrect reinstallation of the clean air line in some workshops. The incorrect reinstallation is a deviation from our work instruction.</p> <p>There is no known fault caused by the actuator motor itself.</p>			4420	9

	<p>In Voluntary Safety Recall U73, some 2017-2018 MY Chrysler Pacifica PHEV vehicles contain Powertrain Control ("PCM") Software that does not remove positive torque requests from the engine controller if the CAN-C bus stops communicating while the cruise control is requesting positive torque. In the instance of a short in the vehicle causing the CAN-C bus to stop communicating while the cruise control is active and the vehicle speed is below the set speed such that the cruise control system is requesting positive torque at the exact moment of the short, it is possible for a positive torque request to be locked on the PCM which may result in either the vehicle maintaining its current speed or possibly accelerating. If the driver does not shift to neutral or apply the brakes to stop the vehicle this condition can cause a vehicle crash without warning.</p> <p>2285 The vehicles noted above may also have Battery Pack Control Module ("BPCM") software that allows Permanent Fault Codes ("PFC") to clear immediately after a Mode \$04 is executed.</p>			3324	3324
	<p>In Voluntary Safety Recall U73, some 2017-2018 MY Chrysler Pacifica PHEV vehicles contain Powertrain Control ("PCM") Software that does not remove positive torque requests from the engine controller if the CAN-C bus stops communicating while the cruise control is requesting positive torque. In the instance of a short in the vehicle causing the CAN-C bus to stop communicating while the cruise control is active and the vehicle speed is below the set speed such that the cruise control system is requesting positive torque at the exact moment of the short, it is possible for a positive torque request to be locked on the PCM which may result in either the vehicle maintaining its current speed or possibly accelerating. If the driver does not shift to neutral or apply the brakes to stop the vehicle this condition can cause a vehicle crash without warning.</p> <p>2286 The vehicles noted above may also have Battery Pack Control Module ("BPCM") software that allows Permanent Fault Codes ("PFC") to clear immediately after a Mode \$04 is executed.</p>			3324	3324
	<p>Some 2015 model year Rio/Soul vehicles equipped with 1.6 liter engines have experienced a malfunction indicator lamp (MIL) illumination with the diagnostic trouble code P0420, indicating a catalyst system. According to the investigation, overheating of a catalyst converter which is caused by inaccurate Catalytic Overheating Protection (COP) logic, could be a cause of this issue.</p> <p>2287 To improve this matter, Kia has been reprogramming the ECU data with improved COP condition to protect and replace the catalyst converter on vehicles with malfunctioning indicator light (MIL) illumination (diagnostic trouble code P0420) through a dealer service campaign since April 2019.</p> <p>2288 On some 2017-2018 Nissan Pathfinder and Infiniti QX60 vehicles, customers are experiencing MIL illumination related to low fuel system pressure (P0087), when a problem does not exist. Nissan has investigated and found that, under certain conditions (fuel level below 1/2 tank), the low fuel system pressure is detected because the low fuel level was not properly stored as part of the mo</p>			83698 87934	479 53
	<p>Excessive wear on internal component of the Intake Variable Camshaft Timing Solenoid may lead to premature failure of the solenoid. As component wears correct operation of the solenoid may be affected leading to Malfunction Indicator Light (MIL) illumination. Where wear is sufficient to prevent correct operation, MIL illumination will occur.</p> <p>2289 Excessive wear has been attributed to internal component material selection of bronze graphite.</p>			19217	10

	<p>Daimler has identified two main root causes, which may lead to replacement of the pressure gauge converter.</p> <p>1)The diagnostic thresholds of the pressure gauge converter sensor might be calibrated too sensitively/narrowly. Therefore, in certain circumstances, an error of the pressure gauge converter sensor could be set and the MIL could be activated erroneously. In this case, the sensor is actually not malfunctioning.</p> <p>2)An incorrect position of the gold plates within the pressure gauge converter sensor can lead to internal short circuits to ground. Therefore, an error of the pressure gauge converter sensor could be set and the MIL could be activated.</p>				5755	21

	<p>2362 Due to inappropriate calibration of the OBD system, the Three way catalytic converter (TWC) monitoring frequency may be insufficient and below the In Use Performance Ratio (IUPR) requirements.</p> <p>2363 Due to inappropriate calibration of the OBD system, the Three way catalytic converter (TWC) monitoring frequency may be insufficient and below the In Use Performance Ratio (IUPR) requirements.</p>	1/30/2018 8/1/2018	7/16/2018 6/26/2019	1324 1496	0 0
	<p>The affected part number 11617801943 relates to the VENTURI TO THROTTLE O-RING (PROFILE GASKET). Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMX03.0NS7, BMW decided a warranty extension to full useful life (10 years / 120.000mils) (Please see corresponding EDIR-OG-AS7/N47.0311). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component VENTURI TO THROTTLE O-RING (PROFILE GASKET) is/was working properly and has/had no malfunction.</p>	6/30/2015	10/30/2016	1209	298
	<p>Wrong screwing/Connection of the high pressure pump (HDP) on selected model year 2018 and 2019 vehicles with 8-cylinder engines N63 produced between 10/10/2018 and 05/08/2019 (based on evaluation of the screwing curve) could lead to the following scenario:</p> <p>During engine operation this wrong screwing/connection of the HDP could get untightened, the HDP experiences an overload so that the adapter of the HDP could break. As a result the connected fuel line could get untightened so that fuel could leak from the fuel line. The drop down of the fuel rail pressure will be detected by OBD including fault code storage and MIL illumination. In case of further drop down a limp home mode will be activated including information for the driver.</p>	10/9/2018	6/4/2019	100 281077	100 3474
	<p>2371 Some 2014-2016 vehicles equipped with a 3.6L Pentastar Classic engine (EHB) may have rocker arm axle/bearings that wear prematurely, causing the rocker arm to function inappropriately. If this should occur, a MIL is illuminated and P-codes P0301-P0306, for misfire, are stored.</p>

2438	Some 2017-2019 model year Hyundai Elantra vehicles equipped with 2.0L engines have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P030X. According to the investigation, the main causes are improper data calibration for cylinder imbalance fuel adaption in the case of deteriorated cylinder engine roughness and moisture entering the ignit			5948
2439	Some 2017-2019 model year Hyundai Elantra vehicles equipped with 2.0L engines have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P030X. According to the investigation, the main causes are improper data calibration for cylinder imbalance fuel adaption in the case of deteriorated cylinder engine roughness and moisture entering the ignit			240837
2440	Some 2017-2019 model year Hyundai Elantra vehicles equipped with 2.0L engines have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P030X. According to the investigation, the main causes are improper data calibration for cylinder imbalance fuel adaption in the case of deteriorated cylinder engine roughness and moisture entering the ignit			15617
2441	The 2023MY Hyundai i EL Veloster, 2023MY 2.0L Tucson and 2023MY i EL Elantra GT have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P0128. According to the investigation, the main cause is an improper data calibration for the modeling temperature of the engine coolant. Data in the ECU has a difference of temperature between modelin			3148
2442	The affected part number 135377800601 relates to the FUEL RAIL [PRESSURE ACCUMULATOR]. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMW02.0N47, BMW decided a warranty extension to full useful life (10 years / 120,000mi.) (Please see corresponding EDIR-GG-N57/N47-0311). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50,000mi.). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FUEL RAIL [PRESSURE ACCUMULATOR] is/was working properly and has/had no malfunction.	6/30/2015	6/29/2016	1579
2443	he 2013 model year Velosters equipped with 1.6 TGD engine have experienced a safety issue which can cause a vehicle fire. According to the internal investigation, the engine management software installed on the engine electronic control units (ECUs???) in the subject vehicles could cause premature ignition of air/fuel mixture in the engine cylinder (Type: ignition??). Pre-ignition in an	4/11/2017	3/22/2018	16240
2444	Due to inappropriate PCM software, the 12V battery state of charge may be estimated to be lower than the actual state of charge. As a result, under certain driving conditions the idle stop operation may be incorrectly inhibited.	4/11/2017	3/22/2018	20451
2445	Due to inappropriate PCM software, the 12V battery state of charge may be estimated to be lower than the actual state of charge. As a result, under certain driving conditions the idle stop operation may be incorrectly inhibited.	4/2/2018	3/14/2019	17854
2446	Due to inappropriate PCM software, the 12V battery state of charge may be estimated to be lower than the actual state of charge. As a result, under certain driving conditions the idle stop operation may be incorrectly inhibited.	7/15/2016	3/27/2017	11247
2447	Some 2015-2017 Dodge Charger SRT and Dodge Challenger SRT vehicles equipped with a 6.2L Hellcat engine (sales code 5D0) are having catalytic converters replaced. Customers are bringing in their vehicles after Malfunction Indicator Lamp (MIL) illumination (P-codes P020 and P030 for catalyst efficiency are set).			4096
2448	On some 2016-2018 Infiniti Q50 and Q60 vehicles, customers are experiencing a MIL illumination related to the Mass Air Flow sensor (DTC P0101, P0108), and in some cases, a MIL may also illuminate for the Manifold Absolute Pressure sensor (DTC P0106). Infiniti has investigated and found that, under certain conditions, air flow learning may occur during additional throttle valve openin			39168
2449	On some 2016-2018 Infiniti Q50 and Q60 vehicles, customers are experiencing a MIL illumination related to the Mass Air Flow sensor (DTC P0101, P0108), and in some cases, a MIL may also illuminate for the Manifold Absolute Pressure sensor (DTC P0106). Infiniti has investigated and found that, under certain conditions, air flow learning may occur during additional throttle valve openin			43136
2450	On some 2016-2018 Infiniti Q50 and Q60 vehicles, customers are experiencing a MIL illumination related to the Mass Air Flow sensor (DTC P0101, P0108), and in some cases, a MIL may also illuminate for the Manifold Absolute Pressure sensor (DTC P0106). Infiniti has investigated and found that, under certain conditions, air flow learning may occur during additional throttle valve openin			39168
2451	On some 2016-2018 Infiniti Q50 and Q60 vehicles, customers are experiencing a MIL illumination related to the Mass Air Flow sensor (DTC P0101, P0108), and in some cases, a MIL may also illuminate for the Manifold Absolute Pressure sensor (DTC P0106). Infiniti has investigated and found that, under certain conditions, air flow learning may occur during additional throttle valve openin			39168
2452	On some 2016-2018 Infiniti Q50 and Q60 vehicles, customers are experiencing a MIL illumination related to the Mass Air Flow sensor (DTC P0101, P0108), and in some cases, a MIL may also illuminate for the Manifold Absolute Pressure sensor (DTC P0106). Infiniti has investigated and found that, under certain conditions, air flow learning may occur during additional throttle valve openin			39168
2453	On some 2016-2018 Infiniti Q50 and Q60 vehicles, customers are experiencing a MIL illumination related to the Mass Air Flow sensor (DTC P0101, P0108), and in some cases, a MIL may also illuminate for the Manifold Absolute Pressure sensor (DTC P0106). Infiniti has investigated and found that, under certain conditions, air flow learning may occur during additional throttle valve openin			15819
2454	On some 2016-2018 Infiniti Q50 and Q60 vehicles, customers are experiencing a MIL illumination related to the Mass Air Flow sensor (DTC P0101, P0108), and in some cases, a MIL may also illuminate for the Manifold Absolute Pressure sensor (DTC P0106). Infiniti has investigated and found that, under certain conditions, air flow learning may occur during additional throttle valve openin			39168
2455	On some 2016-2018 Infiniti Q50 and Q60 vehicles, customers are experiencing a MIL illumination related to the Mass Air Flow sensor (DTC P0101, P0108), and in some cases, a MIL may also illuminate for the Manifold Absolute Pressure sensor (DTC P0106). Infiniti has investigated and found that, under certain conditions, air flow learning may occur during additional throttle valve openin			43136
2456	On some 2016-2018 Infiniti Q50 and Q60 vehicles, customers are experiencing a MIL illumination related to the Mass Air Flow sensor (DTC P0101, P0108), and in some cases, a MIL may also illuminate for the Manifold Absolute Pressure sensor (DTC P0106). Infiniti has investigated and found that, under certain conditions, air flow learning may occur during additional throttle valve openin			39168
2457	On some 2016-2018 Infiniti Q50 and Q60 vehicles, customers are experiencing a MIL illumination related to the Mass Air Flow sensor (DTC P0101, P0108), and in some cases, a MIL may also illuminate for the Manifold Absolute Pressure sensor (DTC P0106). Infiniti has investigated and found that, under certain conditions, air flow learning may occur during additional throttle valve openin			43136
2458	2019 model year KIA Niro/Optima hybrid and plug-in hybrid have an issue that is inappropriate display of the freeze frame data to a general scan tool. According to the investigation, when multiple DTCs are set including misfire or fuel system DTC, the ECU cannot display correctly the misfire or the fuel system freeze frame information after ignition off and on. The main cause is that ECU has been calibrated improperly when it comes to display freeze frame data if it occurs multiple DTCs.			300
2459	Kia found that the salt crystals kept the poppet valve of the NVLD stuck open (not closing the pressure switch) which caused it to detect a leak in the evaporative system. It is assumed that the salt crystals originated from the contents of sea breeze and fog coming from the California coast area.			6741
2460	Component: Fuel low pressure sensor (LPS). The LPS provides a value for closed loop control of the fuel pressure before the high pressure fuel rail. The circuit board inside the LPS is protected by a gel coating. The analysis of returned warranty parts indicate the gel has been found to be in various states of degradation. If the gel is degraded damage to the circuit board may occur, resulting in an activation of the Malfunction Indicator Lamp (MIL). If the sensor fails table values are used as replacement for the fuel pump target load. The concerned sensor went of production 2016 week 16.			15305
2461	Component: Fuel low pressure sensor (LPS). The LPS provides a value for closed loop control of the fuel pressure before the high pressure fuel rail. The circuit board inside the LPS is protected by a gel coating. The analysis of returned warranty parts indicate the gel has been found to be in various states of degradation. If the gel is degraded damage to the circuit board may occur, resulting in an activation of the Malfunction Indicator Lamp (MIL). If the sensor fails table values are used as replacement for the fuel pump target load. The concerned sensor went of production 2016 week 16.			15305
2462	Component: Fuel low pressure sensor (LPS). The LPS provides a value for closed loop control of the fuel pressure before the high pressure fuel rail. The circuit board inside the LPS is protected by a gel coating. The analysis of returned warranty parts indicate the gel has been found to be in various states of degradation. If the gel is degraded damage to the circuit board may occur, resulting in an activation of the Malfunction Indicator Lamp (MIL). If the sensor fails table values are used as replacement for the fuel pump target load. The concerned sensor went of production 2016 week 16.			33968

	<p>If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine N74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.</p>	2/28/2019	5/7/2019	63784	63784

	<p>If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine N74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.</p>	6/30/2018	5/7/2019	4484	4484

	<p>Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire. If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs.</p> <p>These can include:</p> <ul style="list-style-type: none">?Coolant loss with Check-Control-Indication?Loss of power with ? If applicable ? Check-Control-Indication (depending on grade of damage)?Smell of exhaust gas?Unusual noise from the engine compartment?Smoke development from the engine <p>In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740iL xDrive 535d and 535d xDrive) produced between 07/01/2013 and 05/31/2017</p>	3/31/2016	7/30/2017	15	15

Q		R	S	T	U
2563	Customer vehicles may exhibit a fuel smell and/or leak from the engine compartment. In rare cases, extended cranking may occur during engine start. This condition is the result of some direct fuel injector O-rings that may split under fuel pressure.			2344	2344
2564	Customer vehicles may exhibit a fuel smell and/or leak from the engine compartment. In rare cases, extended cranking may occur during engine start. This condition is the result of some direct fuel injector O-rings that may split under fuel pressure.			834	834
2565	Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire. If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs. These can include: Coolant loss with Check-Control-Indication Loss of power with 7 if applicable 7 Check-Control-Indication (depending on grade of damage) Smell of exhaust gas Unusual noise from the engine compartment Smoke development from the engine In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740Li xDrive 535d and 535d xDrive) produced between 07/01/2013 and 05/31/2017.	6/30/2014	6/29/2015	3701	3701
2566	Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire. If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs. These can include: Coolant loss with Check-Control-Indication Loss of power with 7 if applicable 7 Check-Control-Indication (depending on grade of damage) Smell of exhaust gas Unusual noise from the engine compartment Smoke development from the engine In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. 2569	On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL).	6/30/2016	6/29/2017	1654	1654
2570	On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL).	5/1/2017	4/30/2018	9612	0
2571	On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL).	5/1/2017	4/30/2018	9612	0
2572	On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL).	5/1/2017	4/30/2018	1549	0
2573	The affected part number 13538627842 relates to the FUEL INJECTOR which is used beginning with 04/2017 solely as replacement part in service when original built injector with part number 13537645956 has to be replaced. Fuel injector with part number 13538627842 includes an improvement regarding tightness due to a DLC (Diamond-Like Carbon) coated ball inside of the injector. The following analysis applies therefore to the original built fuel injector with part number 13537645956. Analysis have shown, that the component has been replaced in about 31% up to 42% (depending on Test Group) due to malfunctions of the component itself. The main reason for those malfunctions could be identified in defective filter material. In case this material shows breaks pollutant particles lead to temporary or steady leakages of the injection valve. These leakages could have an impact on drivability (e.g. bucking engine run) showing misfires, which are detected by OBD system storing a fault code with MIL illumination. More reasonable malfunctions are caused by seating of the valve injection holes or damaged valves (e.g. breaks in valve seat or broken valve seats). In the other 58% up to 69% (depending on Test group) of all cases, the component injection valve has been replaced although it hasn't had a malfunction itself. Other components like ignition coil, high pressure sensor or ignition plugs have been in those cases the genuine reason for fault code storage and MIL illumination.	2/28/2014	6/29/2015	11459	963

	<p>The part numbers 11157601453, 11158635843 and 11158647299 relate to the vent hose connecting line. Part number 11157601453 with index 03 has been used in production between 07/12 and 09/13. Between 10/2013 and 04/14 a modified component with same part number but different index (index 04) has substituted component with index 03 as production and as replacement part. This new part exhibits a notched ring, which should stabilize some due to temperature impact fragile areas of the vent hose connecting line. Between 05/14 and 06/15 an additional hardware improvement on the pipe connector has been introduced in production and as replacement part (part number 11158635843). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. This new component with part number 11158647299 is used since 07/15 in production and as a replacement part for previous model years.</p> <p>Analysis have shown that in about 90% the original assembled part with part number 11157601453 has been replaced because of leakage problems caused by fragile parts of the vent hose connecting line. These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. Since the usage of part number 11158635843, these problems could be reduced to 60% valid replacements.</p> <p>A complete elimination of the hardware issue could be fulfilled with introduction of the new material used with part number 11158647299.</p> <p>The component vent hose connecting line with part number 11158647299 therefore is robust, has/had no malfunction and is/was working properly.</p> <p>Considering the afore mentioned explanations the Weibull results and valid fail values listed in this report relate to the less-robust component vent hose connecting line with part numbers 11157601453 and 11158635843.</p>	6/30/2012	6/29/2013	39763	2400

This new component with part number 11158647299 is used since 07/15 in production and as a replacement part for previous model years.</p> <p>Analysis have shown that in about 90% the original assembled part with part number 11157601453 has been replaced because of leakage problems caused by fragile parts of the vent hose connecting line. These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. Since the usage of part number 11158635843, these problems could be reduced to 60% valid replacements.</p> <p>A complete elimination of the hardware issue could be fulfilled with introduction of the new material used with part number 11158647299.</p> <p>The component vent hose connecting line with part number 11158647299 therefore is robust, has/had no malfunction and is/was working properly.</p> <p>Considering the afore mentioned explanations the Weibull results and valid fail values listed in this report relate to the less-robust component vent hose connecting line with part numbers 11157601453 and 11158635843.</p>	2/28/2014	4/29/2014	1150	100
2695	<p>The part numbers 11157601453, 11158635843 and 11158647299 relate to the vent hose connecting line. Part number 11157601453 with index 03 has been used in production between 07/12 and 09/13. Between 10/2013 and 04/14 a modified component with same part number but different index (index 04) has substituted component with index 03 as production and as replacement part. This new part exhibits a notched ring, which should stabilize some due to temperature impact fragile areas of the vent hose connecting line. Between 05/14 and 06/15 an additional hardware improvement on the pipe connector has been introduced in production and as replacement part (part number 11158635843). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. This new component with part number 11158647299 is used since 07/15 in production and as a replacement part for previous model years.</p> <p>Analysis have shown that in about 90% the original assembled part with part number 11157601453 has been replaced because of leakage problems caused by fragile parts of the vent hose connecting line. 	<p>The part numbers 11157640285, 11158637873 and 11158647961 relate to the vent pipe PCV. Part number 11157640285 with index 01 has been used in production between 07/12 and 01/14. Between 02/2014 and 04/14 a modified component with same part number but different index (index 03) has substituted component with index 01 as production and as replacement part. This new part exhibits a notched ring, which should stabilize some due to temperature impact fragile areas of the vent pipe. Between 05/14 and 06/15 an additional hardware improvement in the welding geometry of the vent pipe has been introduced in production and as replacement part (part number 11158637873). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. This new component with part number 11158647961 is used since 07/15 in production and as current replacement part for vehicles produced before. Analysis have shown that in about 90% the original assembled part with part number 11157640285 has been replaced because of leakage problems caused by fragile parts of the vent pipe. These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. Since the usage of part number 11158637873 in 05/14, these problems could be reduced to 60% valid replacements. A complete elimination of the hardware issue could be fulfilled with introduction of the new material used with part number 11158647961 beginning with 07/15. The component vent pipe PCV with part number 11158647961 therefore is robust, has/ had no malfunction and is/ was working properly. Considering the afore mentioned explanations the Weibull results and valid fail values listed in this report relate to the less-robust component vent pipe PCV with part numbers 11157640285 and 11158637873.</p>	2/28/2013	4/29/2014	15633	1200

2737	Diagnostic Modules for tank leak detection (DM-TL), part number 97020127601, are being replaced in the field for illuminating the MIL. Faults P049600 and P0441 are most frequently stored.	10/1/2013	5/26/2014	755	45
2738	Tank ventilation valves (part numbers 94611002033, 94611002034, 94611002035 and 94611002036) are being replaced in the field due to the MIL being illuminated. Fault P0456 is most frequently stored. Most likely erroneous replacement for NVLD (Pressure switch) issue (see EDIR 0093).			14252	28
2740	Tank ventilation valves (part numbers 94611002033, 94611002034, 94611002035 and 94611002036) are being replaced in the field due to the MIL being illuminated. Fault P0456 is most frequently stored. Most likely erroneous replacement for NVLD (Pressure switch) issue (see EDIR 0093).	9/12/2014	5/21/2015	12718	65
2741	In certain vehicles the hybrid drive motor battery cell pouches may leak electrolyte internally in the battery pack. This can cause a loss of cell voltage and reduced battery pack capacity. The leak is likely a result of moisture in the air that enters the battery pack vent and interacts with internal components. Incidents of such leaks have been identified primarily in hot and humid states. A			533	0
2742	The Engine Control Module (ECM) in certain vehicles was manufactured with a circuit board that was not properly cleaned during circuit board manufacturing. Contamination on the circuit board may cause failed solder joints or open circuits in the traces of the circuit board. The defect is limited to one lot of circuit boards.			15	15
	Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in regions with high ambient temperatures (±100 deg. F). The vehicles are able to be restarted.				
2743	Nissan has investigated and found that this issue is caused by the ECM miscalculating the amount of purge gas inside the evap canister in extreme hot weather conditions. When this occurs, excess gas enters the engine causing the engine to run rich and hesitate/stop.			2277	0
	Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in regions with high ambient temperatures (±100 deg. F). The vehicles are able to be restarted.

2750	Oil line restrictors are being replaced in the field for MIL illumination. Fault codes most frequently stored are P1372 for valve lift and P000A, P000C camshaft slow response for bank 1 and bank 2, respectively.	6/10/2013	5/28/2014	4166	80
	Post catalyst oxygen sensors (part numbers 9A790626550 and 9A790626551) are being replaced in the field for MIL illumination. Fault codes most frequently stored are P227000 and/or P227200- "Oxygen Sensor bank 1 and/or 2 Signal Stuck Lean". Analysis shows that the reference air canal of the sensor was contaminated with Silicone (SiO2) that originated from the cable protection sheath. The sheath was changed to an alternative material.				
2751	Analysis also showed that the temperature of the sensor was too low during diagnosis, so the heating model of the engine ECU software was changed.			3107	261
	The subject vehicles are equipped with a 3.5L V6 2GR-FSE gasoline engine with an intake port injection system containing two fuel pulsation dampers. The diaphragm material in the fuel pulsation dampers may harden over time due to a chemical process involving amine in the fuel, higher ethanol content in fuels used in countries such as the U.S., Canada, and China, and high temperatures. If this were to occur, cracks could develop on the diaphragm, causing fuel to leak. A fuel leak in the presence of an ignition source can increase the risk of a vehicle fire.				
2752				241	241

If this were to occur, cracks could develop on the diaphragm, causing fuel to leak. A fuel leak in the presence of an ignition source can increase the risk of a vehicle fire.

2755	Coolant temperature sensors, part number 95510612501, are being replaced in the field due to MIL illumination and/or a warning of coolant temperature too high in the instrument cluster, prompting immediate customer action. Most frequent fault code stored is P0116.			14489	33
	Post catalyst oxygen sensors (pn 95B60617200) are being replaced in the field for MIL illumination. The most frequently stored faults are P2A00/P2A03-pre catalyst electrical failure bank1/bank2 and/or P0135/P0155-pre catalyst heater open circuit bank1/bank2. Most of the sensors are being replaced erroneously, due to faults stored for the pre-catalyst oxygen sensor stored in the engine ECU.				
2756		3/12/2013	5/24/2014	4166	76
	Hyundai Motors America, Inc. is conducting an important Product Improvement Campaign to perform a software update on 2015 MY Sonata vehicles equipped with 2.4L 2.0L GDI engines to protect the engine from connecting rod bearing damage. The update will only involve the addition of newly developed computer software for the Engine Control Unit (ECU).				
2757	Hyundai recently developed a Knock Sensor Detection System (KSDS) that detects vibrations indicating the onset of connecting rod bearing wear in the engine. The KSDS is designed to alert a vehicle driver at an early stage of bearing wear before the occurrence of engine damage including engine failure.			135809	0

	Q	R	S	T	U
	Customer Complaint: Fuel smell Component: Fuel Line Production Part Number: 079133986AB Replacement Part Number: 079133986AF				
2758	Analysis: Over time, the fuel supply line for the high pressure fuel pump may become porous, resulting in a fuel smell or a fuel leak.			1281	1281
	Customer Complaint: MIL on, and whistling sound from engine compartment. Component: PCV Valve/Oil Separator Production Part Number: 079103542B Warranty Replacement Part Number: 079103542E DTC present: - P2297 (Intake Air System Leak - adaption valve monitoring) - P0507 (Idle Control System - RPM Higher than expected)				
2759	Analysis reflects part number 079103542B Analyzed components showed a cracked membrane and/or broken check valve within the module of crankcase ventilation system.			4827	262
	The affected part number 13537805423 relates to the PRESSURE ACCUMULATOR (FUEL RAIL). Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2015 Test Group FBMV03.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils). Please see corresponding EDIR-OF-N57/N47-0267. In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component PRESSURE ACCUMULATOR (FUEL RAIL) is/was working properly and has/had				
2760	no malfunction.	6/30/2014	5/31/2015	1505	348
2761	In certain vehicles, fuel in the high pressure fuel pump may hydraulically force open the pressure regulator valve prior to the control system commanding this valve to open. If this occurs it is possible for this valve movement to induce a back-EMF voltage into the engine control module circuit. The engine control module detects such a change in voltage as a control circuit fault and, then			85101	153
2762	DAG has determined that insufficient robustness with regard to environmental impacts, such as increased moisture, could lead to electrical failures of the differential pressure sensor. As a result, the fault is stored in the engine control unit and the engine diagnostics warning lamp (MIL) is activated.			6539	288
2763	DAG has determined that insufficient robustness with regard to environmental impacts, such as increased moisture, could lead to electrical failures of the differential pressure sensor. As a result, the fault is stored in the engine control unit and the engine diagnostics warning lamp (MIL) is activated.			4279	353
2764	DAG has determined that insufficient robustness with regard to environmental impacts, such as increased moisture, could lead to electrical failures of the differential pressure sensor. As a result, the fault is stored in the engine control unit and the engine diagnostics warning lamp (MIL) is activated.			11547	935
2765	The thermostat inserts (part# 95810612601 and 95810612602) are being replaced in the field for illuminating the MIL. Fault P2181 is usually stored. Analysis has found that the plastic body of the thermostat was deforming and allowing an internal coolant bypass. Also, for 2016MY, the diagnosis of the warm up behavior was inaccurate. The part and the software have been updated.			1036	25
2766	Thermostat inserts (part# 95810612601 and 95810612602) are being replaced in the field for illuminating the MIL. Fault P2181 is usually stored. Analysis has found that the plastic body of the thermostat was deforming and allowing an internal coolant bypass. Also, for 2016MY, the diagnosis of the warm up behavior was inaccurate. The part and the software have been updated.			1036	25
	The affected part number 11787614322 relates to the Heated Rear Oxygen Sensor. Analyses have shown, that the component rear oxygen sensor was replaced in 100% of all cases due to different valid malfunctions: a) Contamination of the oxygen sensor (boron is dispensed from the boron nitride disk) b) Break of the ceramic caused by vibrations due to material degradation in the heater element causes by phase shifting from tetragonal to a monocline phase in the area of the through-connection holes of the ceramics c) Signal adulteration caused by humidity entrance via plug of the oxygen sensor All of this malfunctions lead to an OBD fault code storage (e.g. P0141 and P0161) including MIL illumination.				
2767		2/28/2013	5/31/2014	15275	1833

2768		2/28/2013	5/31/2014	15275	1833
2769	Customer vehicle may exhibit decreased front windshield defroster performance at extremely low ambient temperatures. This condition may be the result of the fresh/recirculation servo actuator separating from the servo, causing the HVAC system to become stuck in recirculation.			11213	11213
2770	Customer vehicle may exhibit decreased front windshield defroster performance at extremely low ambient temperatures. This condition may be the result of the fresh/recirculation servo actuator separating from the servo, causing the HVAC system to become stuck in recirculation.			63694	63694
2771	Vehicles equipped with a 3UR-FBE flex fuel engine may experience a MIL 70N77 condition with DTCs P0171 (System Too Lean Bank 1), P0172 (System Too Rich Bank 1), P0174 (System Too Lean Bank 2), P0175 (System Too Rich Bank 2), P1604 (Start Failure Determination) and/or extended cranking. This condition is caused by fuel pressure below specification.			30022	30022
2772	Vehicles equipped with a 3UR-FBE flex fuel engine may experience a MIL 70N77 condition with DTCs P0171 (System Too Lean Bank 1), P0172 (System Too Rich Bank 1), P0174 (System Too Lean Bank 2), P0175 (System Too Rich Bank 2), P1604 (Start Failure Determination) and/or extended cranking. This condition is caused by fuel pressure below specification.			30022	30022
2773	Under a certain combination of engine operating events a single fuel injector may be remain open for up to 7.5 seconds due to an engine control module (ECM) software anomaly. This can result in low fuel rail pressure and cause an engine misfire event. The potential for this combination of events to occur under normal vehicle operation is very low.			759	1
	Post catalyst oxygen sensors (part numbers 9A790626550 and 9A790626551) are being replaced in the field for MIL illumination. Fault codes most frequently stored are P227000 and/or P227200: "Oxygen Sensor bank 1 and/or 2 Signal Stuck Lean" Analysis shows that the reference air canal of the sensor was contaminated with Silicone (SiO2) that originated from the cable protection sheath. The sheath was changed to an alternative material. Analysis also showed that the temperature of the sensor was too low during diagnosis, so the heating model of the engine ECU software for the 3.0L version was changed.	10/10/2016	6/13/2017	3107	261
	The subject vehicles are equipped with a 3.5L V6 2GR-FSE gasoline engine with an intake port injection system containing two fuel pulsation dampers. The diaphragm material in the fuel pulsation dampers may harden over time due to a chemical process involving amine in the fuel, higher ethanol content in fuels used in countries such as the U.S., Canada, and China, and high temperatures. If this were to occur, cracks could develop on the diaphragm, causing fuel to leak. A fuel leak in the presence of an ignition source can increase the risk of a vehicle fire.			924	924

	<div>Some 2018 model year Kia Stinger, Cadenza, 2019 model year Sedona, Optima, Sorento vehicles have the misprinted on the engine oil filler caps. Original viscosity is 5W-30, but 0W-30 mark was printed. The supplier made a mistake in selection of the printing plate. Kia will replace the misprinted filler caps with the right ones.</div>			307	307
2823	Some 2015-16 2.3L Mustang gasoline turbocharged direct injection (GTDI) vehicles may experience damage to the check valve internal seal or have a displaced membrane on the evaporative emissions canister purge valve (CPV), which are both components to the fuel vapor hose assembly.			41238	4241
2824					
	<div>The affected part number 13907614013 relates to the FUEL TANK BREATHER VALVE. Analyses have shown, that in 100% of all cases one of the following two different hardware failures could cause the malfunctioning tank breather valve, which are both detected by the OBD system (fault code entry including MIL illumination): Failure #1 (Knobs failure mode): The rubber structure of the knobs pressed in the hole of the valve bumper could crack in the area between chamfer and hole and in the following could detach and get lost in the backside. Due to the missing rubber structure there is a metal to metal contact in the fuel tank breather valve, which could result in a blocked valve and could lead to a too lean fuel mixture, which is detected by the OBD. Failure #2 (Retractable membrane): Due to failures in the production process the retractable membrane (plastic material) of the non-return valve could brake completely. This malfunction could be caused either by an extruding failure or by a pre-damage of the membrane due to a ridge on the seat engaging surface of the anker. For vehicles with one fuel tank breather valve this malfunction (broken membrane) will be detected by the OBD as small leakage, for vehicles with two valve as a leakage of the second purge line.</div>	6/30/2015	6/29/2016	16499	4950

2826	<p>The affected part number 13518604232 relates to the component HIGH PRESSURE FUEL PUMP.</p> <p>Analysis have shown that in about 81% of all cases the high pressure pump has been replaced due to a correct fault code entry and MIL illumination, identifying the malfunction of that specific component. Deterioration of gasoline filter materials emitting small filter particles, lead to a blockade of the high pressure valve. The deterioration of the gasoline filter could be traced back to high temperature conditions and low gasoline quality respectively inadequate gasoline additives.</p> <p>Beginning with 12/2015 a new filter material (PPEEK?? instead of PA) for the filter was introduced in production and services.</p>	2/28/2014	5/31/2015	11445	1259

2835	Due to incorrect programming of the PCM, after disconnecting the battery the PCM does not output the slave CPU calibration ID in response to the second and subsequent requests of a Generic Scan Tool (GST).	12/4/2017		96	9
2836	The OBD system may falsely detect a malfunction of the "Shift by wire Control (Incorrect parking lock indication)" when driver push "parking" button in a certain condition.	11/16/2017	10/15/2018	49027	1
	<p>2019 model year KIA Soul equipped with 1.6L engine have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P0128. According to the investigation, the main cause for this condition is an improper calibration of the engine coolant modeling temperature data. The ECU has a difference between modeling temperature data of the engine coolant and the actual engine coolant Temperature data. To correct this problem, Kia will reprogram the ECU data</p>			30906	42

2842	<p>Complaint: MIL and/or Runs Rough Cause: ECM Software 1)Diagnostic signal for Knock Sensor 2 is too low/high and unauthorized error messages are generated. 2)With dynamic load changes misfires can occur (without DTCs). 3)Oil level warning lamp is illuminated (too high). 4)Misfire in COD operation (Cylinder On Demand). 5)The stopping time of the coolant pump may be, under certain conditions, too short to prevent cooling system damage. Correction: updated ECM software 1)The knock sensor diagnostic has been optimized (data adjustment). 2)The combustion is adapted and optimized in the engine control. 3)The threshold for oil level warning is too small. Consequently the threshold for the oil level warning has been increased and adapted. The request for warming up occurs earlier. 4)The running time while in COD mode is reduced. To prevent misfires when switching to full engine operation, the parameters have been adjusted. 5)The stopping time of the coolant pump was adjusted to prevent damage to the cooling system. 	<p>Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire.</p> <p>If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs.</p> <p>These can include:</p> <ul style="list-style-type: none">?Coolant loss with Check-Control-Indication?Loss of power with ? if applicable ? Check-Control-Indication (depending on grade of damage)?Smell of exhaust gas?Unusual noise from the engine compartment?Smoke development from the engine <p>In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740Li xDrive 535d and 535d xDrive) produced between 07/01/2013 and 05/31/2017</p>	6/30/2013	6/29/2014	10900	10900

	<p>Daimler AG has determined that on certain GLF-Class (platform 166), SL-Class (platform 172), C-Class (platform 204), E-Class (platforms 207, 212), S-Class (platforms 216, 217, 221, 222), CLS-Class (platform 218), SL-Class (platform 231), R-Class (platform 251), GLC-Class (platform 253), G-Class (platform 463) vehicles with 4-, 6- and 8-cylinder gasoline engines catalyst heating might not be active in one special use case. The issue only occurs when the following unusual circumstances occur in combination:</p> <p>The engine is turned off after a driving cycle where it was fully warmed up. At the next engine-start / driving cycle the engine is started and turned off after no more than 2 seconds of operation. At the subsequent engine start / driving cycle catalyst-heating is not activated.</p> <p>In this case, due to a delayed heating up of the catalyst, an impact on emissions cannot be ruled out.</p>			1348	0

	<p>The affected part number 13538616079 relates to component injection valve (fuel injector) by supplier Continental, which is only used for model X6 xDrive50i (for model X5 xDrive50i an injector by supplier Bosch is built; please see also EDIR-0E-N63TUE-0251). This part number 13538616079 is used in production beginning with 02/2013. Analyses have shown, that in about 50% of all cases the component injection valve was replaced due to misfire events including fault code storage and MIL illumination. In general these misfire events were caused by an electrical malfunction (faulty operation of the injector) due to contamination (welding bead) at the contact/connection caused by the supplier during the production process. In addition leakages due to gelation of the compensator (in general after a dead time of 2 up to 3 years due to oxygen entered in the compensator oil of the fuel injector) or a defective filter material (filter material shows breaks pollutant particles leading to temporary or steady leakages of the injection valve) could also lead to the misfire events. In the other 50% of all cases, the component injection valve has been replaced although it hasn't had a malfunction itself. In these cases other components like ignition coil, high pressure sensor or ignition plugs have been in those cases the genuine reason for the fault code storage (e.g. for misfire) and MIL illumination.</p>	3/31/2013	12/30/2014	4615	2215

	<p>Daimler AG has determined that certain MY12-18 vehicles of diverse platforms could experience a software error. If a short cut occurred within the injector while the engine was switched off, the failure code for this short cut would not be stored and the MIL would not be activated. However, in case of a confirmed short cut, the MIL would be activated by a subsequent failure mechanism (misfire detection) and the workshop would replace the correct part. Based on a field claim analysis of potentially affected vehicles worldwide, the probability of occurrence of the described failure is lower than 0.00018 %.</p>			1330	0

2894	Based on manufacturer technical/data analysis, BMW detected a software failure implemented on all BMW/MINI vehicles with Bosch Engine Control Module MEVD17.2.3 produced between 03/01/2018 by 07/31/2018. Failure description: The locking of the ECM is implemented to avoid the manual deleting of permanent diagnostic trouble codes (DTC). If the locking is not active, (permanent) DTCs could be deleted manually with a diagnostic tool. In the affected ECMs/Vehicles the locking of ECM is not active.	2/28/2018	10/30/2019	532	532
2895	Based on manufacturer technical/data analysis, BMW detected a software failure implemented on all BMW/MINI vehicles with Bosch Engine Control Module MEVD17.2.3 produced between 03/01/2018 by 07/31/2018. Failure description: The locking of the ECM is implemented to avoid the manual deleting of permanent diagnostic trouble codes (DTC). If the locking is not active, (permanent) DTCs could be deleted manually with a diagnostic tool. In the affected ECMs/Vehicles the locking of ECM is not active.	2/28/2018	2/27/2019	6144	6144
2896	The affected part number 13537805423 relates to the FUEL RAIL [PRESSURE ACCUMULATOR]. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMXV03.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils). Please see corresponding EDIR-OG-N57/N47-0311. In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FUEL RAIL [PRESSURE ACCUMULATOR] is/was working properly and has/had no malfunction.	6/30/2015	9/30/2016	1209	359
2897	A customer may express a concern that the Malfunction Indicator Lamp (MIL) is illuminated on the Instrument Cluster (IC) with the following DTCs: P2096 or P2097. This may be caused by an oversensitivity within the On-board Diagnostics (OBD) resulting in a false flag.			1996	235
2898	The OBD system may falsely detect a malfunction of the P0716 "Input speed sensor performance check" in a certain condition.	2/2/2015	11/7/2016	134326	314
2899	The OBD system may falsely detect a malfunction of the P0716 "Input speed sensor performance check" in a certain condition.	2/2/2015	11/7/2016	134326	314
2900	The OBD system may falsely detect a malfunction of the P0716 "Input speed sensor performance check" in a certain condition.	4/11/2017	3/22/2018	20451	0
2901	The affected part number 11538674895 relates to the Thermostat (including a map controlled heating element). This component has been used beginning with 07/2016 in production. It also has been used in service since 07/2016 as replacement part, whenever a component with part number 11537647751 used in production by 06/2016 was malfunctioning. Analysis has shown, that in about 100 percent of all cases for model year 2016 models listed above, the originally built thermostat (11537647751) was replaced due to a disconnected pin of the heating element caused by corrosion due to moisture ingress in the thermostat housing. The corrosion leads to an increased power resistance of the connecting (pin), which is detected by the OBD system including fault code storage and MIL illumination. After this thermostat malfunction is detected (confirmed), the thermostat is still mechanical controlled (wax elements melts due to rising engine cooling water temperature and not map controlled by the heating element anymore) as a conventional thermostat. The successfully built in thermostat (11538674895) didn't show significant numbers of malfunctions as pre described and so could be handled as a robust hardware. The Weibull and valid failure values reported in this document for test group GBMXV01.6N18 and part number 11538674895 relates therefore to the build thermostat with part number 11537647751. Component with part number 11538674895 is a robust hardware and itself has/had no malfunction, but was/is working properly.	6/30/2015	10/30/2016	13901	4782

2922	Analysis:Supplier Bosch disclosed an ECM Software fault in combination with an the aging front oxygen sensor (Field analysis confirmed that this effect may occur over mileage 50,000 mi)				33065	53
2923	On some 2019 Infiniti QX50 vehicles, customers have experienced a fuel odor inside the vehicle's cabin. Infiniti has investigated and found that the end point of the Evap canister filter vent hose is connected to a portion of the frame member which also shares a small connection to the cabin through a body panel flange. Under certain conditions (hot ambient air temperature / HVAC system operation) a fuel odor may be present inside the cabin.					
2924	The affected part number 13537805423 relates to the FUEL RAIL [PRESSURE ACCUMULATOR]. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2018 Test Group JBMXT03.ON57, BMW decided a warranty extension to full useful life (10 years / 120,000mi) (please see EDIR-01-A57-0325). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50,000mi). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FUEL RAIL [PRESSURE ACCUMULATOR] is/was working properly					
2925	and has/had no malfunction.					
2926	DAG has determined that the depressed valve system (exhaust) could cause increased lateral forces in the valve guide, which increase wear in the guide and can lead to wear of the seat ring. In this case, the tightness of the combustion chamber (valve to seat ring) could be impaired. In case of an untight combustion chamber, misfires could occur leading to a deactivation of the respective cylinder.	8/31/2017	7/30/2018		3366	552
2927					24739	159
2928	Sodium in the fuel may contaminate the surface of the fuel pump motor brushes that may cause fuel flow to decrease. As a result, the MIL may illuminate for P0087 "Fuel System Pressure (Low)" or in some cases vehicle may stall.	5/18/2015	11/7/2016		79007	135
2929	Sodium in the fuel may contaminate the surface of the fuel pump motor brushes that may cause fuel flow to decrease. As a result, the MIL may illuminate for P0087 "Fuel System Pressure (Low)" or in some cases vehicle may stall.	4/2/2018			15812	2
2930	Due to inappropriate calibration of the PCM and TCM, engine oil may be diluted with fuel when short trip driving operation is repeated during winter season in cold weather (low engine oil temperature condition). After that, when fully warmed up the diluted fuel in the engine oil may evaporate rapidly and the MIL may illuminate	7/25/2016	10/3/2017		49404	31

2937	DAG has identified three main root causes which may cause failure of the up-stream and down-stream NOx sensors. 1) Oscillating signal: An increased resistance in the air reference electrode of the sensor may lead to increased Nernst voltage which may cause the modulator to oscillate. This situation leads to a permanent deterioration of the sensor signal quality. 2) Crack due to therm			15737	175
2938	Some 2014 MY Jeep Cherokee (KL) vehicles equipped with a 3.2L engine (Sales code: EHB) may experience a loss of motive power while driving due to a commanded shift to neutral, most likely at highway speeds. This event most frequently occurs during the 7th-8th gear shift due to a sticking clutch valve that will prevent the dog clutch from releasing. If the vehicle should experience this c			93211	3383
2939	If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine N74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.	2/28/2018	2/27/2019	5792	5792
2940	If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). 	<p>If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine N74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.</p>	2/28/2017	6/29/2018	5805	5805

2971	<p>Some 2014-2019MY Ram 1500 ("D5") Trucks equipped with a 5.7L engine may experience exhaust manifold fastener failures due to metallurgical fatigue. This situation has the potential to cause both an unusual noise (ticking) from the engine compartment, as well as a localized gasket leak located at the exhaust manifold-cylinder head interface.</p>			242079	1305
2972	<p>Some 2014-2019MY Ram 1500 ("D5") Trucks equipped with a 5.7L engine may experience exhaust manifold fastener failures due to metallurgical fatigue. This situation has the potential to cause both an unusual noise (ticking) from the engine compartment, as well as a localized gasket leak located at the exhaust manifold-cylinder head interface.</p>			66081	0
2973	<p>Originally FCA US reported that on some 2015-2016 MY 3.6L Dodge Charger and Chrysler 300 fleet vehicles are experiencing replacements of the left side fuel pump module. An extended warranty is being provided which will cover 2011-2016 MY Dodge Charger (Pursuit) vehicles equipped with sales code AHB - Police Group. AFCA US review of 58 warranty claims found that of the 58 fuel pump/level units replaced for the following reasons: 4 (6.9%) due to a no start condition, 48 (82.8%) due to a fuel smell or leak at the flange and 2 (3.5%) due to a fuel level sensor issue. The remaining 4 (6.9%) units were right side fuel pump/level unit modules. The two primary types of failure are caused by a melted electrical connector which is part of the top flange and a failed capacitor inside the left fuel pump module. First, an internal capacitor within the left fuel pump module may have been damaged during the fuel pump assembly process which results in a vehicle no start. Second, the majority of these vehicles are police vehicles. A combination of the extended run time of these vehicles causes temperature to increase along with temperature generated by the flow of current to the fuel pump. This is causing the electrical connector/flange to melt and allow fuel vapor to escape.</p>			3958	3958
2974	<p>Hyundai Motors America, Inc. is conducting an important Product Improvement Campaign to update software on 2011-2018 MY Sonata, 2013-2018 MY Santa Fe Sport, 2014-2015 MY and 2018 MY Tucson vehicles equipped with 2.0L and 2.4L GDI engines to protect the engine from connecting rod bearing damage.. The update will only involve the addition of newly developed computer software for the Engine Control Unit (ECU). Hyundai recently developed a Knock Sensor Detection System (KSDS) that detects vibrations indicating the onset of connecting rod bearing wear in the engine. The KSDS is designed to alert a vehicle driver at an early stage of bearing wear before the occurrence of engine damage including engine failure.</p>			38785	0

Replacement: SQ0 131 984 E SC0 131 984 E 561 131 984 D Analysis: Leak at welded joint near the quick connector (to AdBlue Dosing Injector) due to glue residue contamination on the AdBlue supply line during manufacturing. Consequential replacement of the dosing injector (04L 131 113 Q) due to damage incurred from a supply line leak or improper diagnosis of the leak source. AdBlue residue forming at injector flange.			36485	7654
	Complaint: Customers may notice a fuel odor. DTCs Present: No DTCs. Component: Fuel Rail Repair Kit (includes Fuel Rails). Part Number ? Production (Test Group: Fuel Rail Part Number [Left, Right]): PVGA03.0AUE: 06E130089AA, 06E130090AD; GVGA03.0AUE: 06E130089Q, 06E130090T; HVGA03.0AUT: 06E130089Q, 06E130090T; PVGA03.0AUE: 06E130089Q, 06E130090T; JVGA03.0AUE: 06E130089AH, 06E130090AL. Part Number ? Replacement: 06E198201B (includes: left fuel rail 06E 133-681 L and right fuel rail 06E 133-682 C) Part Number ? Analysis (Test Group: Fuel Rail Part Number [Left, Right]): PVGA03.0AUE: 06E130089AA, 06E130090AD; GVGA03.0AUE: 06E130089Q, 06E130090T; HVGA03.0AUT: 06E130089Q, 06E130090T; PVGA03.0AUE: 06E130089Q, 06E130090T; JVGA03.0AUE: 06E130089AH, 06E130090AL. 2985 Analysis: On certain vehicles, a small amount of fuel may leak from one or both fuel rails. In the presence of an ignition source, leaking fuel may result in a fire. 2986 On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL). 2987 On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL). 2988 On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL). 2989 On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL). 2990 On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL).	5/1/2017	4/30/2018	38895	38895

	Complaint: On affected vehicles, the Mechatronic Unit service replacement was configured with a European software calibration. DTCs Present: Not applicable Component: Mechatronic Unit Part Number ? Production: OCG 325 025 B 202 with SW (5801) Part Number ? Replacement: OCG 325 025 B 203 with SW (6404 and 6304) Part Number ? Analysis: OCG 325 025 B 202 with SW (5801) Analysis: Due to a sorting issue at the transmission supplier, the mechatronic software versions were switched between Europe and USA/Canada-specific software. As a result, these affected US vehicles which received service replacement parts will not have Mode \$0A enabled.			1882	1882
	2991 2019 model year Hyundai Accent equipped with 1.6L engine have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P0128. According to the investigation, the main cause is an improper data calibration for modeling temperature of the engine coolant data in ECU that has a difference of the temperature between modeling data of the engine cool-			22965	71

	Q	R	S	T	U
	<p>Following NOx sensor components have been introduced into production and as spare parts in service during the specific time periods:</p> <p>10/13 - 07/16: NOx sensor (downstream) with part number 13628576469 (models 328d and X5 xDrive35d), NOx sensor (downstream) with part number 13628576470 (model X3 xDrive28d), NOx sensor (downstream) with part number 13628576471 (models 535d and 740Ld xDrive) NOx sensor (upstream) with part number 13628576471 (models 535d, 740Ld xDrive, 328d, X5 xDrive35d and X3 xDrive28d)</p> <p>07/16 - now: NOx sensor (upstream) with part number 13628589846 (models 535d, 740Ld xDrive, 328d, X5 xDrive35d and X3 xDrive28d) NOx sensor (downstream) with part number 13628589845 (model X3 xDrive28d) NOx sensor (downstream) with part number 13628589844 (models 328d and X5 xDrive35d) NOx sensor (downstream) with part number 13628589846 (models 535d and 740Ld xDrive)</p> <p>Components with part numbers 13628589844, 13628589845, 13628589846 are improved / more robust NOx sensors, which have been used as spare part in service since 07/2016, whenever NOx sensors with above listed part numbers used before 07/16 were malfunctioning. Analysis have shown that component NOx sensor (up- and downstream) with above listed part numbers used before 07/16 have been replaced due to a Magnesium intoxication (major root cause of all malfunctions) as well as due to other permanent or temporarily errors as electrical malfunctions (short to ground or open circuit), all with a corresponding OBD fault code storage and MIL illumination.</p> <p>2993 Since 07/16 the component NOx sensor up- and downstream with part numbers 13628589844, 13628589845, 13628589846 have been used in production and as spare parts in service. Those components have/had no malfunctions and are/were working properly.</p> <p>2994 Due to inappropriate software of the OBD system, the MIL bulb check and readiness blinking are not appropriately output under a certain condition and/or multiple Permanent diagnostic trouble codes are not correctly output under certain conditions.</p>	<p>7/31/2014</p> <p>3/31/2017</p>	<p>7/30/2015</p> <p>7/26/2017</p>	<p>7403</p> <p>2962</p>	<p>1451</p> <p>0</p>
	<p>Cold Start Neutral, where idle speed is elevated to warm the catalytic convertor quickly, may be inhibited without triggering the Malfunction Indicator Light. Cold Start Neutral is inhibited when the data signal from the Gear Shift Module or Anti-Lock Brake System are invalid. MIL illumination does not occur.</p> <p>2995 Revision: Further investigation has confirmed that in all known operating instances the Powertrain Control Module detects the fault and does successfully trigger MIL illumination. Further investigation has established that there is no defect present as was originally described below.</p>			<p>0</p>	<p>0</p>
	<p>Certain vehicles of model NCV3 could experience thermal damage of the SCR metering valve and SCR metering line. This could be due to two different root causes: 1. The defect can be the consequence of escaping hot exhaust gas is a result of loose and defective components on the exhaust system (decoupling element corroded, pipe clamp or NOx sensor loose after previous repair). As a result of the defect, no pressure can be built up in the SCR metering line. This is then detected through the diagnosis of the SCR delivery module and the MIL is activated. 2. The defect could be the consequence of a 7misuse-scenario??, where an incorrect fueling of otto-fuel into the diesel fuel tank can lead to increased temperatures on the exhaust side and thus damage the SCR metering valve and metering line. In this case, the correct amount of AdBlue cannot be supplied to the exhaust system any more. The malfunction would be detected through the diagnosis of the SCR metering valve and the MIL would be illuminated.</p> <p>In both aforementioned cases, the SCR warning scenario is activated, which initiates the start limit with a count down of 12 max. possible vehicle starts. In both cases, performance and vehicle speed are not limited</p> <p>2996</p>			<p>15696</p>	<p>2303</p>

3105	<p>Due to tolerance variations of the supercharger housing (up to 3007m ot of specification) caused in the production process by the supplier, the turbine wheel and the impeller could rub against the housing. Besides noise the turbine wheel and the impeller could be damaged so that the supercharger could fail completely and the engine is working afterwards with natural aspiration only. The damaged supercharger will be detected by the OBD system, a corresponding DTC is set and the MIL will be illuminated.</p> <p>Worldwide 25 superchargers were identified with this tolerance variation. For the US market overall 1 vehicle is affected which could be blocked at the dealership.</p>	6/16/2019	6/16/2019	1	1
3106	<p>Daimler has identified two main root causes, which may lead to replacement of the pressure gauge converter.</p> <p>1) The diagnostic thresholds of the pressure gauge converter sensor might be calibrated too sensitively/narrowly. Therefore, in certain circumstances, an error of the pressure gauge converter sensor could be set and the MIL could be activated erroneously. In this case, the sensor is actually not malfunctioning.</p> <p>2) An incorrect position of the gold plates within the pressure gauge converter sensor can lead to internal short circuits to ground. Therefore, an error of the pressure gauge converter sensor could be set and the MIL could be activated.</p>			3407	77

	The affected part number 16117243975 relates to component FUEL PUMP [DELIVERY MODULE] by supplier Bosch. Analyses have shown that the impeller inside the fuel pump could block due to high dust contamination in combination with NiP (Nickel-Phosphor) abrasion and accumulation (separated NiP particles from the internal fuel pump coating). Particularly the production period 09/2013 through 03/2014 shows an increased risk of potential blocking due to a coating charge with 38% Phosphor. The NiP coating was primary introduced to increase the durability regarding ethanol. Due to the potential blocking, the coating in the fuel pump was changed to Eloxal beginning with 04/2014 (fuel pump built in production and fuel pump used as replacement part in service). This more robust hardware (to prevent the potential blocking of the impeller) has still part number 16117243975.

3136	Humidity within the exhaust flow is able to enter the sensor chamber containing the ceramic component. This humidity may be absorbed by the ceramic material. When heated the absorbed liquid may vaporise leading to de-lamination cracking. The Malfunction Indicator Light (MIL) is illuminated and a diagnostic trouble code (DTC) relevant to the failed component is stored within the			22977	919
3137	A manufacturing fault at the supplier results in misalignment within the post-catalyst heated oxygen sensor leading to a side load on a ceramic internal part. This pre-stress, in combination with normal vehicle use, leads to premature component malfunction. The condition causes the Malfunction Indicator Lamp (MIL) to be illuminated and diagnostic trouble codes (DTC%), relevant to the post-catalyst heated oxygen sensors, to be stored in the Engine Control Module (ECM).			18202	1656
3138	The affected part number 13517588879 relates to the high pressure pump from supplier Continental which is also currently used as replacement part in services. Analyses have shown, that in about 90% of all cases due to confirmed malfunctions of the high pressure pump. Main reasons for the high pressure fuel pump malfunctions are oil losses caused by a cracked coupling or shaft spin. Both malfunctions, which can effect emissions, lead to reduced pressure in the fuel system and result in a pressure fuel pump and engine limp home with noticeable engine performance reduction (including MIL illumination). In addition, the high pressure fuel pump is also replaced due to a sporadically sticking flow control valve which results in fault code storage and occasionally MIL illumination. In the about other 10% of all cases the component high pressure pump was replaced without any corresponding fault code storage and without MIL illumination.	7/31/2010	6/29/2011	690	321

	<p>Calibration Concerns: Scan Tool Mode \$0A, this is a Non-erasable permanent DTCs (Mode \$0A) for fuel rail pressure monitoring. The issue was discovered during PVE [i][2] testing and was reported to the agencies on May 7, 2018 (Gen 2.1 SUV and July 2, 2018 (Gen 2 PC)</p> <p>Calibration Concerns: NOx Sensor Rationality monitor, this is a NOx Sensor out-of-range monitor without function (P2202, P2203, P22A0 and P22A1). The issue was discovered during PVE [i][2] testing and was reported to the agencies on May 7, 2018 (Gen 2.1 SUV and July 2, 2018 (Gen 2 PC)</p> <p>Calibration Concerns: Throttle Valve Rationality monitor: The issue was discovered during PVE [i][2] testing and was reported to the agencies on May 7, 2018</p> <p>Calibration Concerns: Oxidation Catalyst (DOC) efficiency monitor, The issue occurs during high altitude driving conditions, requires replacement of the DOC (impacting durability), and is caused by a modified calibration in the field fix. To fix this issue will require a modification to the AEM</p> <p>Calibration Concerns: Boost system Rationality monitor, Boost system gross leakage monitor with limited function. The issue was discovered during PVE [i][2] testing and was reported to the agencies on May 7, 2018</p> <p>Calibration Concerns: Engine Control Module (ECM) Inhibit relations, Planned improvements of inhibit relations to avoid additional fault codes and ensure reliable guidance for service. The issue was discovered during PVE [i][2] testing and was reported to the agencies on July 2, 2018.</p> <p>Calibration Concerns: Engine Control Module (ECM) Injection Limitation, Reduction of the fuel injection pattern at high ECM temperatures and low battery voltage. This issue has not caused customer complaints and is unlikely to occur in ordinary driving conditions. Fixing this issue does not require changing the AEM.</p> <p>Calibration Concerns: Service-Tester/Tools, Service base setting to adjust idle speed. This is a minor change designed for dealer diagnostics. It does not change the AEM calibration</p> <p>Calibration Concerns: Vehicle Drivability (Poor Fuel Adaptation), Customer complaints regarding drivability during engine warm-up. The issue affects drivability of the vehicle, occurs during ordinary vehicle operation and use, and is caused by a modified calibration in the field fix. To fix this issue will require a modification to the AEM.</p> <p>Calibration Concerns: Reductant Supply Module, The SCR module is being replaced due to a false MIL condition resulting from high temperatures/diagnostic thresholds of consumption deviation monitor. The change will impact the AEM calibration, but the change is not required to fix this Technical Issue. The proposed change is an improvement for the issue, but not a complete solution.</p> <p>GenerationModelMYCal IDECU/TCU</p> <p>Gen 2.1 SUVQ720134L2910401A0011 AVABECU</p> <p>Gen 2.1 SUVfourareg201337P0907401K 0011 AVABECU</p> <p>Gen 2 PCA620144G0907401N 0013 BVABECU</p> <p>Gen 2 PCA720144G0907401N 0013 BVABECU</p> <p>Gen 2 PCA820144H0907401F 0013 BVABECU</p> <p>Gen 2 PCQ520148K9074011 0011 BVABECU</p> <p>Gen 2.1 SUVQ720144L2910401A0012 AVABECU</p> <p>Gen 2.1 SUVfourareg20147P0907401K 0011 AVABECU</p> <p>Gen 2.1 SUVfourareg20130C8927750AK 3398TCU</p> <p>Gen 2.1 SUVfourareg20140C8927750CF 3376TCU</p> <p>Gen 2 PCA6/A720144G0927158AQ 1006/1008TCU</p> <p>Gen 2 PCA820144H1927158AM 1008 TCU</p> <p>Gen 2 PCA820144H1927158CX 1008 TCU</p> <p>Gen 2 PCQ52014 BR0927158Q 1007TCU</p>				2961	2961
3142	<p>The affected part numbers 51747497279 respectively 51137497285 and 51138091760 respectively 51748091762 relate to the components upper respectively lower air flaps (Active Grill Shutters). Please note that only the 7-Series models 750i xDrive (SWB), 750i and 750i xDrive and the 5-Series model M550i xDrive are equipped with active grill shutters. All other models included in model year 2018 test group JBMXJ04.4N63 have no active grill shutters built.</p> <p>The affected part numbers 51747497279 and 51137497285 for components upper and lower air flaps relate only to the 5-Series model M550i xDrive.</p> <p>The affected part numbers 51138091760 and 51748091762 for components upper and lower air flap relate only to the 7-Series models 750i xDrive (SWB), 750i and 750i xDrive.</p> <p>Analyses have shown that components lower and upper air flaps with part numbers 51747497279 respectively 51137497285 and 51138091760 respectively 51748091762 were replaced in about 95% of all cases due to a malfunction detected by the OBD system including fault code storage and MIL illumination (e.g. electrical failure of actuator, stuck shutter, shutter performance).</p> <p>There are two different failures which could cause these valid malfunctions:</p> <p>Failure#1 (about 85% of all valid failures): Contamination (mix of transmission oil, brush dust and copper abrasion) of the commutator (daubed commutator silt) leads to an increased current of the actuator so that this component fails.</p> <p>Failure#2 (about 15% of all valid failures): The kinematics /component ?spacer? (connecting element of the coupling bar between actuator and the shutters) could be unhinged or lost, so that the shutters could not be controlled/moved any more.</p>

	Q	R	S	T	U
3170	When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. If this occurs, air flow through the evaporative system may be impacted such that excessive negative pressure is created in the fuel tank. This can cause deformation of the fuel tank, which can lead to fuel tank cracks.	6/1/2012	10/31/2012	1805	1805
3171	When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. If this occurs, air flow through the evaporative system may be impacted such that excessive negative pressure is created in the fuel tank. This can cause deformation of the fuel tank, which can lead to fuel tank cracks.	6/1/2012	10/31/2012	1805	1805
3172	When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. If this occurs, air flow through the evaporative system may be impacted such that excessive negative pressure is created in the fuel tank. This can cause deformation of the fuel tank, which can lead to fuel tank cracks.	6/1/2010	5/31/2011	6120	6120
3173	When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. If this occurs, air flow through the evaporative system may be impacted such that excessive negative pressure is created in the fuel tank. This can cause deformation of the fuel tank, which can lead to fuel tank cracks.	6/1/2011	5/31/2012	6331	6331
3174	When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. If this occurs, air flow through the evaporative system may be impacted such that excessive negative pressure is created in the fuel tank. This can cause deformation of the fuel tank, which can lead to fuel tank cracks.	10/13/2009	5/31/2010	6807	6807
3175	When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. If this occurs, air flow through the evaporative system may be impacted such that excessive negative pressure is created in the fuel tank. This can cause deformation of the fuel tank, which can lead to fuel tank cracks.	6/1/2012	10/31/2012	1805	1805
3176	When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. If this occurs, air flow through the evaporative system may be impacted such that excessive negative pressure is created in the fuel tank. This can cause deformation of the fuel tank, which can lead to fuel tank cracks.	6/1/2010	5/31/2011	6120	6120
3177	When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. 	<p>Component: Fuel low pressure sensor (LPS).</p> <p>The LPS provides a value for closed loop control of the fuel pressure before the high pressure fuel rail.</p> <p>The circuit board inside the LPS is protected by a gel coating. The analysis of returned warranty parts indicate the gel has been found to be in various states of degradation. If the gel is degraded damage to the circuit board may occur, resulting in an activation of the Malfunction Indicator Lamp (MIL). If the sensor fails table values are used as replacement for the fuel pump target load.</p> <p>The concerned sensor went of production 2016 week 16.</p>				
3200	Due to inappropriate PCM software, the 12V battery state of charge may be estimated to be lower than the actual state of charge. As a result, under certain driving conditions the idle stop operation may be incorrectly inhibited.	2/2/2015	11/7/2016	33968 134326	33968 1386
	<p>DAG has identified two main root causes, which may lead to replacement of the exhaust gas recirculation valve:</p> <p>1.A sluggish exhaust gas recirculation valve, due to foreign particles or carbon build up, could lead to a deviation during exhaust gas recirculation control. The deviation will result in illumination of the Malfunction Indicator Lamp (MIL), prompting the driver to visit a servicing dealer.</p> <p>2.An external leakage of the exhaust gas recirculation valve through the connection fitting could result in water with coolant entering the engine bay. Due to the leakage of the exhaust gas recirculation valve, the coolant level might drop gradually, resulting in a warning ?check coolant level?? being displayed in the instrument panel.</p>			1697	51

3215	<p>The affected part number 13538627842 relates to the FUEL INJECTOR which is used beginning with 04/2017 solely as replacement part in service when original built injector with part number 13537645956 has to be replaced. Fuel injector with part number 13538627842 includes an improvement regarding tightness due to a DLC (Diamond-Like-Carbon) coated ball inside of the injector. The following analysis applies therefore to the original built fuel injector with part number 13537645956.</p> <p>Analysis have shown, that the component has been replaced in about 41% due to malfunctions of the component itself. The main reason for those malfunctions could be identified in defective filter material. In case this material shows breaks pollutant particles lead to temporary or steady leakages of the injection valve. These leakages could have an impact on drivability (e.g. bucking engine run) showing misfires, which are detected by OBD system storing a fault code with MIL illumination. More reasonable malfunctions are caused by sooting of the valve injection holes or damaged valves (e.g. breaks in valve seat or broken valve seats).</p> <p>In the other 59% of all cases, the component injection valve has been replaced although it hasn't had a malfunction itself. Other components like ignition coil, high pressure sensor or ignition plugs have been in those cases the genuine reason for fault code storage and MIL illumination.</p>	7/31/2014	7/30/2015	6359	1246
3216	<p>The affected part number 13517588879 relates to the high pressure pump from supplier Continental which is also currently used as replacement part in services.</p> <p>Analyses have shown, that in about 90% of all cases due to confirmed malfunctions of the high pressure pump.</p> <p>Main reasons for the high pressure fuel pump malfunctions are oil losses caused by a cracked coupling or shaft spin. Both malfunctions, which can effect emissions, lead to reduced pressure in the fuel system and result in a pressure fuel pump and engine limp home with noticeable engine performance reduction (including MIL illumination).</p> <p>In addition, the high pressure fuel pump is also replaced due to a sporadically sticking flow control valve which results in fault code storage and occasionally MIL illumination.</p> <p>In the about other 10% of all cases the component high pressure pump was replaced without any corresponding fault code storage and without MIL illumination.</p>	8/31/2009	7/30/2010	18482	5452

3220	Some 2013 and 2014 model year 2.0L Fusion and C-Max plug-in hybrid vehicles were built with transmission assemblies that may require replacement due to differential and transfer shaft bearing retention and lubrication issues.			16996	816
3221	Certain 2018MY Toyota/Lexus vehicles may exhibit a condition in which the rear O2 sensor monitor may not detect a slow response malfunction within the engine exhaust system at the time of fuel cut operation. The Engine Control Module/ECM logic has been modified to prevent misdetection.			13996	13996
3222	Certain 2018MY Toyota/Lexus vehicles may exhibit a condition in which the rear O2 sensor monitor may not detect a slow response malfunction within the engine exhaust system at the time of fuel cut operation. The Engine Control Module/ECM logic has been modified to prevent misdetection.			25015	25015
3223	Certain 2018MY Toyota/Lexus vehicles may exhibit a condition in which the rear O2 sensor monitor may not detect a slow response malfunction within the engine exhaust system at the time of fuel cut operation. The Engine Control Module/ECM logic has been modified to prevent misdetection.			144048	144048
3224	Certain 2018MY Toyota/Lexus vehicles may exhibit a condition in which the rear O2 sensor monitor may not detect a slow response malfunction within the engine exhaust system at the time of fuel cut operation. The Engine Control Module/ECM logic has been modified to prevent misdetection.			25015	25015
3225	<p>2012~2016 model year KIA Souls equipped with 1.6L engine have experienced safety issue of vehicle fire. According to the investigation, overheating of a catalyst converter which is caused by inaccurate Catalytic Overheating Protection (COP) logic could be a cause of this issue.</p> <p>High exhaust gas temperature could damage the catalytic converter and it can cause abnormal combustion and damage pistons and connecting rods. A failed connecting rod can pierce the engine block and cause oil leaks that can cause fires.</p> <p>To correct this problem, Kia will reprogram the ECU data with improved COP condition to protect the catalyst converter and replace the catalytic converter which vehicles have a malfunction indicator light (MIL) illumination with a diagnostic trouble code P0420.</p>			90695	2335

3237	<p>If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine N74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.</p>	6/30/2016	6/29/2017	659	659

3249	<p>If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine N74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.</p>	3/31/2019	5/7/2019	904	904

3260	<p>The affected part number 16117341299 relates to the Fuel Tank Supply Module. Analyses have shown, that the component fuel tank supply module in general was replaced due to a software failure in the ECU (Engine Control Unit). In more detail: The component PT-sensor (pressure/temperature sensor) located inside of the fuel tank supply module is/was monitored also during driving conditions. This could lead to the scenario, that the PT-sensor shows an implausible value (e.g. temperature drop) due to contact with fuel and the OBD diagnostic detects the PT-sensor as malfunctioning (including the corresponding fault code and MIL illumination) although the component PT-sensor is not malfunctioning. As a result the malfunctioning?? PT-sensor was replaced in services by replacing the complete fuel tank supply module. This means that in general the component fuel tank supply module was replaced without being malfunctioning. Beginning with July 2013, BMW has modified the ECU software so that the OBD diagnostics for component PT-sensor are only running during engine off time conditions to avoid the false failure detection and false MIL as described above.</p>	6/30/2012	6/29/2013	0	0

	Q	R	S	T	U
	<p>Hyundai Motors America, Inc. is conducting an important Product Improvement Campaign to update software on 2011~2019 MY Sonata, 2013~2019 MY Santa Fe Sport, 2014~2015 MY and 2018~2019 MY Tucson, and 2019MY Veloster N vehicles equipped with 2.0L and 2.4L GDI engines to protect the engine from connecting rod bearing damage.</p> <p>The update will only involve the addition of newly developed computer software for the Engine Control Unit (ECU).</p> <p>Hyundai recently developed a Knock Sensor Detection System (KSOS) that detects vibrations indicating the onset of connecting rod bearing wear in the engine.</p> <p>The KSOS is designed to alert a vehicle driver at an early stage of bearing wear before the occurrence of engine damage including engine failure.</p>				
	Some 2014~2016 model year KIA Sportage 2.4 GDI SULEV's may exhibit an issue with NMOG control that could lead to an exceedance of the emissions standards. According to our investigation, the main cause is a ECU data calibration is a deviation of injector flow quantity, catalyst heating based on the differences of engine mechanical friction and compensation operated by downstream			59405 11083	0 0

	<p>Some 2019 MY 2.7L and 3.0L gasoline turbocharged direct injection (GTDI) vehicles were built with a positive crankcase ventilation (PCV) valve that was not intended for these applications, which can result in an increased risk of false malfunction indicator light (MIL) illumination.</p>			955	955
	<p>Due to improper Engine Control Module (ECM) programming, under certain circumstances, the ignition coil may be energized longer than designed after the engine is OFF. If the ignition coil remains energized for too long, the internal temperature of ignition coil may increase which could cause a short circuit and a blown fuse. If a s</p>	3/8/2018	6/21/2019	183286	0
	<p>Complaint: MIL on</p> <p>DTCs Present: P0401 (Exhaust Gas Recirculation Flow Insufficient)</p> <p>Components: EGR Filter</p> <p>Part Number ? Incorrect: 1K0253120</p> <p>Part Number ? Correct: 1K0253120B</p> <p>Analysis: Due to a parts catalog error, an incorrect EGR Filter may have been installed on some vehicles during a past service repair visit. VW will inspect and if needed, replace the EGR filter with the correct service part.</p> <p>The wrong EGR filter could affect the DPF OBD diagnosis by not detecting a DPF Fault.</p>			32	32
	<p>Some of 2017/2018 model year Fortes equipped with 2.0 liter (MPi) engines might have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P0300*P0304(multiple or single misfire) set. The cause of this problem is an electric short in the ignition coil due to water absorption.</p>			37034	0
	<p>To correct this problem, Kia has changed to an improved water resistant ignition coil or RFI spring kit.</p>			5035	5035
	<p>During development of 2020MY software calibration for Camry and Avalon, Toyota considered implementing updated transmission control software, including calibration values that can indirectly impact fuel cut activation. However, it was determined that software development modifications would not be carried out for 2020MY, thus the original base software functionality was imple</p>				
	<p>The manufacturing process at the supplier may result in misalignment within the pre-catalyst heated oxygen sensor leading to a side load on a ceramic internal part. This pre-stress, in combination with normal vehicle use, may lead to premature component malfunction.</p> <p>The condition causes the Malfunction Indicator Lamp (MIL) to be illuminated and diagnostic trouble codes (DTCs) relevant to the post-catalyst heated oxygen sensors to be stored in the Engine Control Module (ECM) also known as the Powertrain Control Module (PCM).</p>			6931	468

Differences in the timing of the reset function during ignition-ON resulted in incorrect values of the initialization variables, which are issues in the initial function for crankcase-ventilation function</p>				46035	46035
3400	<p>Due to inappropriate calibration of the PCM, when a large amount of contamination adheres to the throttle body bore, the throttle valve may become stuck at the full closed position and the vehicle won't start. The MIL illuminates P2101 for "Throttle Actuator System Malfunction".</p>	8/16/2013	8/13/2014	119248	119248	
3401	<p>Due to inappropriate programming of the PCM for the Electric Variable Valve Timing Control (EVTC) actuator control, the EVTC control mode may unnecessarily fluctuate under certain conditions. The OBD system may falsely detect a malfunction of P100C for "EVTC actuator rotation signal malfunction".</p>	9/18/2017		11091	55	
3402						
3403	<p>A manufacturing fault at the supplier results in misalignment within the post-catalyst heated oxygen sensor leading to a side load on a ceramic internal part. This pre-stress, in combination with normal vehicle use, leads to premature component malfunction.</p> <p>The condition causes the Malfunction Indicator Lamp (MIL) to be illuminated and diagnostic trouble codes (DTC's), relevant to the post-catalyst heated oxygen sensor, to be stored in the Engine Control Module (ECM), also known as the Powertrain Control Module (PCM).</p>			6737	34	
3404	<p>The part number 13537645956 relates to the component injection valve. Analysis have shown, that the component has been replaced in about 65% due to malfunctions of the component itself. The main reason for those malfunctions could be identified in defective filter material. In case this material shows breaks pollutant particles can pass through the filter and reach the injection valve. This can lead to a malfunction of the injection valve.</p>	2/28/2013	6/29/2014	15264	3588	
3405	<p>Some 2018 MY Jeep® Renegade and Jeep® Cherokee equipped with a 2.4L engine (sales code ED6 or ED8), Fiat 500X equipped with a 2.4L engine (sales code ED8), and Jeep® Compass equipped with a 2.4L engine (sales code ED6, ED8, or EDE) vehicles may experience a Malfunction Indicator Lamp (MIL) illumination, P2226 baromet</p>	12/15/2017	3/7/2018	1652	16	
3406	<p>The engine Malfunction Indicator Lamp (MIL) may be illuminated with Diagnostic Trouble Codes (DTC) flagging a problem with the Valve-Fuel Vapor Purge. 98% of the parts investigated were no-fault-found. The remaining 2% of the parts investigated had failed due to cracking of the valve as a result of extreme vehicle driving maneuvers causing stress on the valve. 95 of the 98% of the no-fault</p>			18067	108	
3407	<p>The joint that connects the high-pressure fuel pump's outer housing to the pump's flange may not have been properly welded by the supplier during the manufacturing process. Over time, the weld could crack, potentially separating the high-pressure fuel pump from the flange and allowing the pump to oscillate inside the engine compartment. If this occurs, the pump's movement could</p>			375	0	
3408	<p>The affected part number 13328572515 relates to the FUEL FILTER W/ HEATER.</p> <p>Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2015 Test Group FBMX03.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils). Please see corresponding EDIR-OF-N57/N47-Q267.</p> <p>In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FUEL FILTER W/ HEATER is/was working properly and has/had no malfunction.</p>	7/31/2014	6/30/2015	7396	957	
3409	<p>Post catalyst oxygen sensors (part number 9A260618300) are being replaced in the field for MIL illumination and fault code P0137 stored in the Engine ECU.</p> <p>Analysis showed polluted oxygen sensors. Residues of soot lead to a negative voltage potential triggering the short to ground diagnosis.</p>	3/17/2016	3/17/2017	5597	86	
3410	<p>The affected part number 13537800601 relates to the Pressure Accumulator (Fuel Rail).</p> <p>Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. 	<p>The part numbers 11157601453, 11158635843 and 11158647299 relate to the vent hose connecting line. Part number 11157601453 with index 03 has been used in production between 07/12 and 09/13. Between 10/2013 and 04/14 a modified component with same part number but different index (index 04) has substituted component with index 03 as production and as replacement part. This new part exhibits a notched ring, which should stabilize some due to temperature impact fragile areas of the vent hose connecting line. Between 05/14 and 06/15 an additional hardware improvement on the pipe connector has been introduced in production and as replacement part (part number 11158635843). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. This new component with part number 11158647299 is used since 07/15 in production and as a replacement part for previous model years.</p> <p>Analysis have shown that in about 90% the original assembled part with part number 11157601453 has been replaced because of leakage problems caused by fragile parts of the vent hose connecting line. These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. Since the usage of part number 11158635843, these problems could be reduced to 60% valid replacements.</p> <p>A complete elimination of the hardware issue could be fulfilled with introduction of the new material used with part number 11158647299.</p> <p>The component vent hose connecting line with part number 11158647299 therefore is robust, has/had no malfunction and is/was working properly.</p> <p>Considering the afore mentioned explanations the Weibull results and valid fail values listed in this report relate to the less-robust component vent hose connecting line with part numbers 11157601453 and 11158635843.</p>	6/30/2012	6/29/2013	39763	2400
	<p>The part numbers 11157601453, 11158635843 and 11158647299 relate to the vent hose connecting line. Part number 11157601453 with index 03 has been used in production between 07/12 and 09/13. Between 10/2013 and 04/14 a modified component with same part number but different index (index 04) has substituted component with index 03 as production and as replacement part. This new part exhibits a notched ring, which should stabilize some due to temperature impact fragile areas of the vent hose connecting line. Between 05/14 and 06/15 an additional hardware improvement on the pipe connector has been introduced in production and as replacement part (part number 11158635843). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. This new component with part number 11158647299 is used since 07/15 in production and as a replacement part for previous model years.</p> <p>Analysis have shown that in about 90% the original assembled part with part number 11157601453 has been replaced because of leakage problems caused by fragile parts of the vent hose connecting line. 	<p>The part numbers 11157640285, 11158637873 and 11158647961 relate to the vent pipe PCV. Part number 11157640285 with index 01 has been used in production between 07/12 and 01/14. Between 02/2014 and 04/14 a modified component with same part number but different index (index 03) has substituted component with index 01 as production and as replacement part. This new part exhibits a notched ring, which should stabilize some due to temperature impact fragile areas of the vent pipe. Between 05/14 and 06/15 an additional hardware improvement in the welding geometry of the vent pipe has been introduced in production and as replacement part (part number 11158637873). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. This new component with part number 11158647961 is used since 07/15 in production and as current replacement part for vehicles produced before. Analysis have shown that in about 90% the original assembled part with part number 11157640285 has been replaced because of leakage problems caused by fragile parts of the vent pipe. These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. Since the usage of part number 11158637873 in 05/14, these problems could be reduced to 60% valid replacements.</p> <p>Complete elimination of the hardware issue could be fulfilled with introduction of the new material used with part number 11158647961 beginning with 07/15.</p> <p>The component vent pipe PCV with part number 11158647961 therefore is robust, has/ had no malfunction and is/ was working properly.</p> <p>Considering the afore mentioned explanations the Weibull results and valid fail values listed in this report relate to the less-robust component vent pipe PCV with part numbers 11157640285 and 11158637873.</p>	6/30/2012	5/31/2013	39763	2400

	<p>Some 2012-2017 model year Hyundai Accent 1.6L and Veloster 1.6L/ turbo vehicles have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P0455. According to the investigation the main cause for this occurrence is a stuck open CCV(Canister Close Valve). The design of air drain case which is a part of filler neck causes the problem if it rains heavily</p>			8467	0
	<p>Some 2015-2018MY 1.4L FIAT Spider Convertible (78A7?), Jeep Renegade (78U7?), FIAT 500 (7FF?), FIAT 500X (7F8?), FIAT LD (7BG?), FIAT 500L (7BF?) and 2018 2.0L Alpha Giulia (7GA?), Alpha Stelvio (7GU?) vehicles that entered commerce may have a calibration that inadvertently suspended some required On-board Diagnostic (POBD?) monitors when the P1D7F fault code is set.</p>				
	<p>This issue occurred when the powertrain control software was modified to correct an issue related to the P1D7F code inadvertently setting during uncommon conditions (i.e. low battery voltage, etc.) and resulting in nuisance Malfunction Indicator Light (7MIL?) faults. The resulting 7fix?? (making P1D7F a non-MIL code) inadvertently resulted in additional OBD-related issues. In particular, analysis revealed that the P1D7F Diagnostic Trouble Code (7DTC?) would suspend the catalyst monitor, upstream O2 monitor, and upstream closed loop control.</p>			1061	1061

	Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in regions with high ambient temperatures (±100 deg. F). The vehicles are able to be restarted.				
3469	Nissan has investigated and found that this issue is caused by the ECM miscalculating the amount of purge gas inside the evap canister in extreme hot weather conditions. When this occurs, excess gas enters the engine causing the engine to run rich and hesitate/stop.			1019	35
	Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in regions with high ambient temperatures (±100 deg. F). The vehicles are able to be restarted.				
3470	Nissan has investigated and found that this issue is caused by the ECM miscalculating the amount of purge gas inside the evap canister in extreme hot weather conditions. When this occurs, excess gas enters the engine causing the engine to run rich and hesitate/stop.			7645	0
	Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in regions with high ambient temperatures (±100 deg. F). The vehicles are able to be restarted.				
3471	Nissan has investigated and found that this issue is caused by the ECM miscalculating the amount of purge gas inside the evap canister in extreme hot weather conditions. When this occurs, excess gas enters the engine causing the engine to run rich and hesitate/stop.			8768	0
3472	Oil line restrictors are being replaced in the field for MIL illumination. Fault codes most frequently stored are P1372 for valve lift and P000A, P000C camshaft slow response for bank 1 and bank 2, respectively.			3174	42
	The subject vehicles are equipped with a 3.5L V6 2GR-FSE gasoline engine with an intake port injection system containing two fuel pulsation dampers. The diaphragm material in the fuel pulsation dampers may harden over time due to a chemical process involving amine in the fuel, higher ethanol content in fuels used in countries such as the U.S., Canada, and China, and high temperatures. If this were to occur, cracks could develop on the diaphragm, causing fuel to leak. A fuel leak in the presence of an ignition source can increase the risk of a vehicle fire.			1403	1403
3473					
	Coolant temperature sensors (part#s 94860642000, 94860642001) are being replaced in the field for illuminating the MIL. Fault P2181 and/or P3081 are usually stored.				
3474	The thermostat, part number 9A310622502, is also replaced (see EDIR B2) on the same repair in many cases and analysis shows that the sensor is not defective.	11/20/2013	9/8/2014	10574	35
	Some 2014-2016 MY Jeep® Grand Cherokee and RAM 1500 vehicles equipped with a 3.0L diesel engine are experiencing DOC/DPF replacements. The Malfunction Indicator Lamp (MIL) illuminates. The majority of the diagnostic trouble codes on the vehicle at the time of part replacement were P2463 (DPF soot accumulation) and P2002 (DPF efficiency below threshold). P1D30 (oil viscosity) and P0420 (catalyst efficiency-bank 1) were present to a lesser extent.				
	FCA US LLC engineering reviewed 2014-2016 model year U.S. market claims for DOC/DPF replacement to assess causal factors on a larger population to ensure statistical significance. Of those, 27% had no related diagnostic trouble codes (DTC??) or information to determine why the DOC/DPF was replaced. The remaining claims revealed the following:				
	-13% of DOC/DPF assemblies were replaced due to damage to the mounting studs (broken/stripped) when attempting to replace the SCR catalyst or repair an exhaust leak at the bolted joint. There was no indication of a DTC or other issue with the DOC/DPF.				
	-57% of the DOC/DPF assemblies were replaced due to the presence of DTC P2463 or P2002. Most of the claims has a service regeneration attempted and failed prior to part replacement. In May 2018, FCA revised the WiTech service tool software to ensure that the Technician would correct any existing DTCs that would prevent the service regeneration from running properly. Since the WiTech software update, 77% of the vehicles were confirmed repaired with the service regeneration and did not require a DOC/DPF replacement.				
	Based on this analysis it likely that 87% of the DOC/DPF replacements had issues with effectiveness DOC/DPF catalyst. The majority of the claims are associated with the level of soot present on the catalyst for which the attempt at a service regeneration was not effective.			32073	428
3475					
	Customer Complaint: Fuel smell Component: Fuel Line Production Part Number: 079133986A8 Replacement Part Number: 079133986AF				
3476	Analysis: Over time, the fuel supply line for the high pressure fuel pump may become porous, resulting in a fuel smell or a fuel leak.			2337	2337
3477	DAC has determined that insufficient robustness with regard to environmental impacts, such as increased moisture, could lead to electrical failures of the differential pressure sensor. As a result, the fault is stored in the engine control unit and the engine diagnostics warning lamp (MIL) is activated.			11527	925
3478	Some 2014 MY 1.5L Fusion gasoline turbocharged direct injection (GTDI) vehicles were built with a catalyst monitor sensor (CMS) that may experience internal damage, which can result in MIL illumination.			21602	1657
	Customer Complaint: MIL on Component: Reductive Agent Supply Module Part Number: 4L0131199M Part analysis reflexes part number: 4L0131899M Possible DTCs found: P20FE Reductant Metering Unit Performance The SCR module is being replaced consequentially due to a false MIL condition resulting from high temperatures / diagnostic thresholds. The Approved Emissions Modification added this OBD diagnostic feature for SCR delivery performance as part of the master series software.				
3479	Audi is currently working to determine a technical solution for the OBD monitor and will release a future updated calibration.			3673	219

3485	DAG has determined that the diesel particulate filter may crack due to an insufficiently robust welded connection. Specific environmental influences in the form of corrosion could also have a negative effect on the long term durability of the diesel particulate filter. This can lead to tensions within the exhaust system and thus also may cause the diesel particulate filter to crack. In addition, in individual cases, it may be that during repairs to the exhaust system that are unrelated to a defect of the diesel particulate filter, the exhaust system was not replaced in accordance with the DAG specifications. Specifically, the issue might arise where it is necessary for the workshop to replace the exhaust system (including the diesel particulate filter) and the replacement system is not fitted according to DAG specifications. This can lead to tensions within the exhaust system and thus may also cause the diesel particulate filter to crack. In both cases, a fault is stored in the engine control unit software and the engine diagnostics warning lamp (MIL) is activated.			6063	552
3486	DAG has determined that an adhesive O-ring in the purge valve can lead to delayed opening of the valve. In this case the OBD-system reacts as intended, the MIL is activated and the stored fault code pinpoints the defective part correctly. In case of the failure, the required negative pressure for the tank leak diagnosis cannot be achieved in the prescribed time, which is defined by internal			1480	111
3487	Customer Complaint: MIL on Component: EGR Cooler Production Part Number: 059131515DD / DN Warranty Replacement Part Number: 059131515 FH The following DTC was observed: P245B (Exhaust Gas recirculation Cooler Bypass Control Circuit Range/Performance) Part analysis reflexes part number: 059131515DD / DN Analysis results part number 059131515DD: Cooling on the bypass valve shaft causing the valve to stick. To resolve this issue a carbon scraper ring was implemented in Production with part number 059131515DN as of cw 05/2013.			4019	196
3488	Customer vehicle may exhibit decreased front windshield defroster performance at extremely low ambient temperatures. This condition may be the result of the fresh/recirculation servo actuator separating from the servo, causing the HVAC system to become stuck in recirculation.			7482	7482
3489	Customer vehicle may exhibit decreased front windshield defroster performance at extremely low ambient temperatures. This condition may be the result of the fresh/recirculation servo actuator separating from the servo, causing the HVAC system to become stuck in recirculation.			135158	135158
3490	Daimler AG has determined that on certain AMG GT/GTS vehicles (190 platform) with 3-cylinder gasoline engine, the software of the engine control unit may not be sufficiently robust with regard to exhaust aftertreatment. As a result, in case the defect occurs in a vehicle, NMOC + NOx emissions may be exceeded within the FTP 75	5/31/2017	5/30/2018	201	0
